WHEN YOU'VE SOLD YOU MUST BE DOING

No Brag, Just Fact!

Over 1,800,000 programs sold to date—and each program includes:

- **Free Customer Technical Support (for all registered users)**
- **A Money Back Guarantee (if you can find a better program, we'll buy it for you)****
- **A very liberal Upgrade & Exchange Policy (which means you never have to worry about obsolete software)****

S.R.P. \$69.95

PARTNER ST

Twelve instantly accessible, memory-resident desktop accessories.

Accessories At Your Command:

- **Instant Thesaurus:** Immediate access to over 60,000 synonyms—while you use your word processor, spreadsheet, or any other program.
- **Appointment Calendar and Datebook:** Keeps track of important dates and deadlines. View entire month on screen—marked with your messages—or produce handy calendar printouts.
- **Memo Pad and Mini-Word Processor**
- **Phone List and Auto Dialer***
- **Expense Account Manager**
- **Vital Statistics:** Instant access to statistical data such as metric equivalents, mileage between cities, toll-free numbers, and area codes.
- **Time Keeper:** Record how your time is spent for a particular day, week, month or year.
- **Full-Function and Financial Calculators**
- **Typewriter:** Use your computer like a traditional typewriter. Perfect for typing envelopes.
- **SwiftDOS:** Easy access to important DOS commands.

PARTNER ST also includes:

- **"Escape!":** A stress-relieving arcade game.
- **A Quick-Start Mini Manual:** Designed to get you up and running in *less than 40 minutes*.

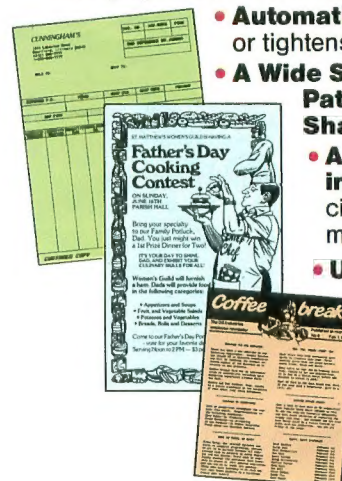

**WORD WRITER ST,
DATA MANAGER ST AND
SWIFTCALC ST INTERFACE
TOGETHER FOR A COMPLETE
PRODUCTIVITY SYSTEM**

The Timeworks Desktop PUBLISHER

Where you once needed a typesetter, designer, and paste-up artist, you can do it all yourself with THE TIMEWORKS DESKTOP PUBLISHER. Includes everything you need to produce professional-quality printed documents on your ST computer!

Features:

- **Automatic Page Style Formatting:** Set up a page style only once. The computer follows it automatically, inserting rules, headers, and footers.
- **A Full-Featured Word Processor**
- **A Wide Variety of Font Styles**—in multiple sizes.
- **A Built-In Text Editor** that allows you to write headlines, taglines, and captions to fit any space.
- **High Resolution Graphics:** Imports illustrations and graphics from leading graphic programs.
- **Automatic Kerning:** Opens or tightens word and letter spacing.
- **A Wide Selection of Built-In Patterns, Textures, and Shades**
- **A Complete Set of Drawing Tools:** Draw lines, boxes, circles, and polygons automatically—or, draw free hand.
- **Use THE TIMEWORKS DESKTOP PUBLISHER to produce:** Newsletters, Brochures, Flyers, Forms, Reports, Bulletins, Menus, Certificates, Letterheads—the possibilities are endless!

*A phone modem is required for this feature.

1,800,007 PROGRAMS, SOMETHING RIGHT.

S.R.P. \$79.95

Word Writer ST

WORD WRITER ST has more features, more power, and is easier-to-use than any other ST word processor!

Features:

- **A Continuous, 90,000-Word Spell Checker** that automatically identifies misspelled words as you type your document.
- **An Integrated Thesaurus** with over 60,000 synonyms and alternatives.
- **On-Screen Underlining, italics and Boldface, Lightface, Subscript and Superscript** are displayed on your screen—as you write.
- **An Outline Processor** that quickly organizes notes, facts, and ideas in convenient outline format.
- **Form Letter Printout (Mail Merge):** Prints multiple copies of the same document while automatically inserting personalized information into the body of each document.
- **A Personal Dictionary:** Allows you to add thousands of your own words (e.g. proper names or technical terms) to WORD WRITER ST's built-in dictionary.

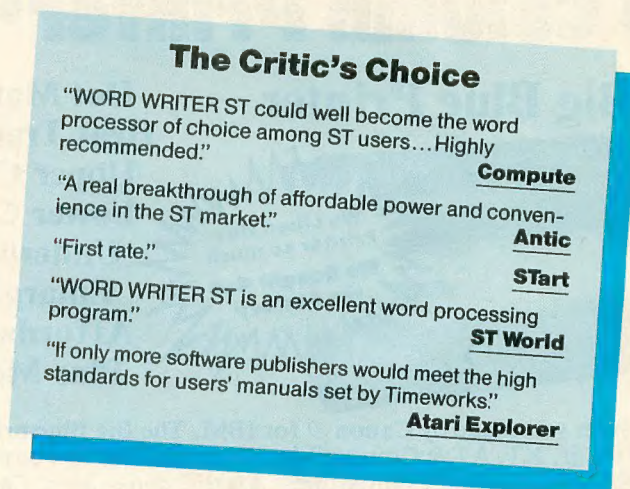

S.R.P. \$79.95

SwiftCalc ST

A powerful, easy-to-use spreadsheet designed for home and business use.

Features:

- **Super Graphics:** Graphically displays and prints out business information using pie charts, bar charts, line plots, point plots, hi-lo-close stock price plots, and more.
- **Sideways:** Lets you print all columns on one continuous sheet...sideways.
- **8192 Rows and 256 Columns Provide Up To 2,097,152 Cells** (locations) in which to place information.
- **Windows:** Allow you to work on two sections of your spreadsheet simultaneously.
- **Help Screens:** Allows you to use the program—without referring to your manual.
- **Formatting:** Choice of formats—decimal (up to 15 places); graphics; exponential notation; \$ sign and commas. Plus, eight user-defined formats.

The Critic's Choice

"WORD WRITER ST could well become the word processor of choice among ST users... Highly recommended."

Compute

"A real breakthrough of affordable power and convenience in the ST market."

Antic

"First rate."

STart

"WORD WRITER ST is an excellent word processing program."

ST World

"If only more software publishers would meet the high standards for users' manuals set by Timeworks."

Atari Explorer

S.R.P. \$79.95

Data Manager ST

A complete general information Storage and Retrieval System with report writing, business graphics, and label making capabilities.

Features:

- **Flexibility** that allows you to modify your data base structure by changing the size or position of fields of information—at any time.
- **A Complete Report Writer** that generates customized data reports. You specify the title, location, and sequence of each column.
- **An Extensive Business Graphics Package** with pie charts, bar charts, line plots, point plots, hi-lo-close stock price plots, and more.
- **Label Maker:** Prints your name and address file onto standard mailing labels, and transfers and prints text information onto labels and tags.

These popular Atari 520/1040 ST+ programs are available at your favorite dealer, or contact Timeworks today.

EZUSE UPGRADE

Thanks for the positive review of USA Construction Set (**Antic**, July 1987). We *do* listen to your comments and upgrade our products if we can. You made a legitimate complaint about having to go through the entire answer database to find the correct answer.

The program has now been enhanced so that three random answers, plus the correct one, are the only ones you have to look at. These will be displayed randomly so that the answer won't always be in the same order. Owners of the older version can receive a free upgrade by mailing their original disk to EZuse Software.

We wish the review had mentioned one of the highlights of the program—ability to print the USA Construction Set in quiz format. The data can be printed sequentially or randomly, as can a selected number. We learned from our Quizmaster Construction Set (reviewed in **Antic**, November 1986) that this is what the users want, especially the educators who bought it for class use.

Antioch, CA 94509

WHEN'S OPRAH ON?

At the television station where I work, my engineering department is responsible for recording numerous programs which are delivered via satellite. Every so often, one of the engineers would forget to record a show. This caused all sorts of grief as other (more expensive) arrangements had to be made to obtain the show before the scheduled air time.

Last year, after hearing of yet another show that wasn't recorded on time, I decided something had to be done. Thus was born the Weekly Event Timer, a BASIC program that generates an obnoxious noise to warn us of an impending show to be recorded. What better way to use my Atari at work?

Richard Kihn

Chief Engineer,

KFDM-TV

Beaumont, TX

DOS HARDWARE WOES

I have a U.S. Doubler and SpartaDOS. I think they make a powerful combination, and with most of my disks at double density, I can't live without it. I forgot that DOS 2.5 and SpartaDOS aren't 100% compatible. Sparta can *read* but *NOT write* sectors above 720 using normal CIO calls. You can't use ERASE to delete DOS 2.5 files above sector 720.

I was writing a disk-dependent program for DOS 2.5 and I foolishly thought I'd just put back my original Atari chips, finish the program and then re-insert the Doubler.

The Atari chips worked fine. I confidently put the Doubler back in, and my 1050 refused to recognize anything. In fact, neither the Doubler *nor* the Atari chips worked. I sent the Atari chips, the drive and \$65 to Atari and got my drive back in two weeks.

Instead of leaving well enough alone, I put the Doubler back in. It worked, but now my drive fails frequently, especially if it's used for more than an hour. Should I send it back and lose two more weeks and another \$65? Buy another drive? Skip town? I don't know.

But I will offer the following advice: Be *very* careful if you're going to install a modification to any of your hardware. Ground your hands by attaching a wire to yourself and a ground source such as a cold water pipe. Be gentle—or, better yet, leave it to a professional.

Mack McLeod

Thornhill, Ontario
Canada

WANTED: ANTIC REVIEWERS

Antic has freelance assignments for reviewers of Atari 8-bit adventures (text or graphics) and fantasy role-playing games. If you are an experienced gamer in either of these categories and can write well, send the Antic Editor a letter about yourself plus a sample of your writing.

We can only consider you for an assignment after seeing some of your writing. If you don't have any relevant writing samples on hand, just write us a review of a game that you know well.

OVERSEAS PACKING

How can I safely ship my disks overseas? Will airport security X-rays affect them? How can I keep the heat and cold which may be encountered during shipping won't hurt them?

F.D. Keel
Las Vegas, NV

Camera shops and some computer stores sell lead-foil bags. Sealing your disks inside these bags should take care of all those problems. —ANTIC ED

BANK STREET HELP

I read Kenny Hom's problem with Bank Street Writer (I/O Board, *Antic*, June 1987). I also have an old version of Bank Street Writer—it won't boot with Atari BASIC revisions B or C. However, it works well with revision A (and a translator on an XL or XE). Another program that requires revision A is Diskey from Adventure International. Diskey is about 90% compatible with revisions B and C, however.

I also have a debugged version of revision A BASIC on disk. I've been unable to boot Bank Street Writer or Diskey with my disk-based BASIC. Is there any way to do this?

Charles Campbell
Indianapolis, IN

COACHWARE WANTED

I'm a high school football coach interested in drawing football plays—mostly involving X's, O's and arrows—with my 800XL and sending them to my Star SG-10 printer. I thought that the Atari light pen might work, but I couldn't find compatible software. So I'm wondering about drawing with the joystick. I'm at an impasse and could use help.

Jerry Culver
Livingston, CA

WHITE HOUSE BANKRUPTCY

White House Computer of Williamsport, Pennsylvania unexpectedly went out of business and filed for bankruptcy. Unfortunately, a number of *Antic* readers have not received goods for which they paid White House. If you are in this situation, contact Postal Inspector Riley, P.O. Box 3747, Scranton, PA 18505-3747.

During the past five years, the overwhelming majority of mail order companies advertising in *Antic* have provided outstanding service and values. However, readers should know that federal postal regulations require mail-order sellers to deliver your purchased goods within 30 days after receiving your order. If you don't obtain your mail order purchase in 30 days, you are entitled to seek action by filing complaints with your local Postmaster General and Better Business Bureau.

MARGINS FOR ERROR

I have an Atari 1200XL, a 1050 disk drive and a 1027 letter quality printer. The printer has "automatic" margins, and when I set margins with the First XLEnt Word Processor, the margins on the printout are 20 columns further in on each side. I've found that I must set margins with [F]lm-10, [F]rm+9. (I have to use "9" in the right margin because the 1027 won't accept lines longer than 80 characters—so I have to send 79 per line.)

Augusto Poitevin
Luquillo, Puerto Rico

We don't currently have a 1027 printer to test this with. However, we'd be interested in knowing if other 1027 owners have this problem with First XLEnt. —ANTIC ED

Help!

ANTIC DATABASE

The manual for Antic dataBASE (August 1987 Super Disk Bonus) appeared on disk in shortened and somewhat garbled form. The complete, corrected manual (42 sectors) is on the October 1987 Antic Disk and can be accessed from the Help Menu—Selection 5 on Side A. Or you can download the manual from the Error Log section of ANTIC ONLINE on CompuServe.

Atari Desktop Publishing

Newest prototype of the Atari Desktop Publishing System is demonstrated at the June, 1987 World of Atari Fair in Santa Clara, California by Mark Jansen of Atari R&D. The interface box can be glimpsed between the Atari laser printer and the 4Mb Mega ST.

Antic welcomes your feedback, but we regret that the large volume of mail makes it impossible for the Editors to reply to everyone. Although we do respond to as much reader correspondence as time permits, our highest priority must be to publish I/O answers to questions that are meaningful to a substantial number of readers.

**Send letters to: Antic I/O Board,
544 Second Street, San Francisco,
CA 94107.**

We didn't mean to set the world on fire.

Honestly, we'd be the first to tell you that if *all* you're interested in are Adventures, stick with your usual brand of software. Simulations only? Keep reaching for them in the same familiar packages! But if you enjoy entertainment software, you probably enjoy the excitement of a whole range of challenges — Adventures and Strategies for long rainy weekends, Arcade games for exhilarating evenings, Simulations when you need to get away from it all. For people like you, Firebird offers top-quality entertainment software in virtually *every* category.

How About These Fireworks From Firebird!

Put KNIGHT ORC on your screen, and lose yourself in a magical world of illusion enhanced by superb graphics, character interaction and cross communication. Once you've battled human oppression as a persecuted Orc, you'll think of Firebird every time you yearn for Adventure!

You'll find the Firebird logo on other addictive Adventures, too — like the breathtakingly illustrated GUILD OF THIEVES, with its revolutionary text-handling system, and the stunning GOLDEN PATH, a journey to enlightenment through the ancient Orient.

Fire From Firebird!

When it comes to fast-paced action Arcade games, nothing beats Firebird's STARGLIDER combat flight simulation — and if you're in the mood for Strategy, let TRACKER introduce you to a totally new concept in tactical warfare.

This is Firebird — the best in entertainment software of every description. We'll prove to you that you don't have to keep switching brands to satisfy your obsession for challenge!

Firebird software for Atari 520 and Amiga systems, including the popular Universal Military Simulator, Pawn, Silicon Dreams, Jewels of Darkness and Advanced Art Studio, is available from \$29.95 to \$44.95.

MARK WILLIAMS C. AN ENLIGHTENING DEVELOPMENT FOR ATARI ST USERS.

If you've tried your hand at developing applications on the Atari ST, you know the problem. Programming tools aren't only hard to come by, they're hard to use. One might even say primitive. But now for some enlightening news: you can have all the power, portability and versatility of the C language from a leader in professional C programming tools, Mark Williams.

BRING YOUR PROGRAMMING UP TO SPEED.

The Mark Williams C compiler produces fast, dense code and supports the complete Kernighan & Ritchie industry standard C. You'll have access to GEM's AES and VDI libraries for programs using graphics, icons and the Atari mouse. And Mark Williams C lets you take advantage of the full 16 megabytes in Atari's 68000 microprocessor.

STREAMLINE DEVELOPMENT WITH POWER UTILITIES.

Mark Williams C is loaded with everything you'll need for professional development. Bring the power of the UNIX environment to your Atari ST with our

NEW VERSION 2.0 FEATURES

- * 50% faster compile time
- * Improved code: 20% faster dhrystone
- * Full access to AES/VDI libraries now with 200 new pages of documentation and dozens of examples
- * New integrated edit-compile cycle: editor automatically points to errors
- * Source and object code for RAM disk cuts compile time in half
- * Complete Kernighan & Ritchie C plus extensions
- * Microshell Command Processor, a powerful UNIX style shell
- * MicroEMACS Full Screen Editor with commented source code
- * Make Program Building Discipline
- * Complete symbolic debugger
- * Assembler, linker and archiver
- * Powerful Utilities Package: one-step compiling/linking with cc command, egrep, sort, diff and more
- * Over 600 pages of documentation including 120 sample C programs
- * Not copy protected

MARK WILLIAMS C FOR THE ATARI ST: \$179.95
60 DAY MONEY BACK GUARANTEE

* Sieve benchmark from Byte, 1983, done on one double-sided floppy disk and included RAM disk.

Microshell Command Processor including pipes, I/O redirection and more. Edit your program with the highly acclaimed MicroEMACS full screen editor. Accelerate and simplify compiling with *make* which finds and recompiles only those modules affected by your changes. Then, when you're ready for debugging, call on our db Symbolic Debugger with single step, breakpoint and stack traceback functions. Over 40 commands, including a linker and assembler, provide a total development package for your Atari ST.

DEPEND ON A NAME WITH A HISTORY OF PERFORMANCE.

Mark Williams C for the Atari ST is part of our growing line of C compilers. A line that includes the C compiler chosen by DEC, Intel, Wang and thousands of professional programmers. Now our Atari C compiler is earning its own reputation:

"Finally a great C compiler that exploits the power of the ST"—Sigmund Hartmann, President, Atari Software Group

"The all-around best choice for serious software development on the ST."—Douglas Weir of *ANALOG COMPUTING*

GET WHAT YOUR ATARI ST HAS BEEN WAITING FOR.

Mark Williams C is just what your Atari ST was made for: powerful, professional programming. So now that you can have Mark Williams C for just \$179.95, what are you waiting for?

Ask your Atari dealer about Mark Williams C or order today by calling **1-800-MWC-1700.***

Reviewed by Jim Pierson-Perry

Hunched over my Atari keyboard, I stared at the screen, my faithful six-string in hand. Staring back in smug innocence was a graphic rendering of various ways to produce a D minor chord up and down the fretboard. Even the guitar strings seemed amused as I tried to assume the finger-position for yet another attempt at this vicious series of inversions. Did Chuck Berry really start this way?

That pitiful scene was caused by working with **Guitar Wizard**, an innovative self-instruction program for mastering guitar chords and scales. At its most basic, this program is a computerized chord-fingering book. But it goes far beyond that to include scale guides and suggestions for improvisational playing, as well as delving deep into alternate string tunings. You can also print the current chord/scale on Epson, Star/Gemini, or Okidata printers.

Guitar Wizard has a convenient menu-driven user interface that is well error-trapped. The chord and scale fingerings appear on a large, easy-to-follow fretboard graphic. The chord/scale fretboard positions can show note name, interval, or fingering. The main screen options are Chord Wizard, Scale Wizard, Fretboard Wizard and Improvisation Wizard.

Chord Wizard displays the fingerings for chords built on any chromatic root at each of nine positions on the fretboard. An overwhelming range of chords is available, from simple majors up to such esoteric modes as 7sus4 and 9/6. There are 32 chord

types, along with more than 12 roots and nine positions, totaling 3,456 variations.

Scale Wizard shows the fingering for 19 different scales built on any chromatic root at any of nine positions on the fretboard—another 2,052 variations. Available scales range from majors and minors to the Greek scales and Blues.

The above choices assume you're using a six-string guitar with standard tuning. If you're adventurous, a special option is available which presents chord/scale fingerings for non-standard tunings. Fretboard Wizard lets you create any tuning and find either a chord or scale. The computer shows all fretboard variations you can pick

from. This is a very powerful feature for advanced study that is seldom described in standard guitar theory books.

Improvisation Wizard helps you select notes that would blend with harmonizing chords the rest of a band might play. An obvious use is to help develop solos to go with a background chord progression. Pick a root note and chord—the program then displays a list of appropriate scales.

Overall, I like this program both for personal use and for its potential as a home study tool for a guitar course. However, there's no sound with the instruction, just the fretboard fingering graphics. It would be nice to have the option of listening to the sound of a chord or scale that's on display.

Is this program for everyone? If your only interest is holding a C major fuzztone for a heavy metal riff, you

can probably get by without it. But if you're actually interested in learning how to play and are willing to put in the practice hours, Guitar Wizard will help. Guitar instructors also should seriously consider using this software for homework or advanced theory lessons.

"Imagine yourself having a drunken argument about whether trout is spelt with FOUR L'S."

"Huh?" I said. But when the question "What is the English word for FORELLE?" popped up on the screen a few minutes later, I knew at once that the answer was "trout." Using images that link foreign words to acoustically similar English words is a technique called imagery.

I'd heard about this method, but as a veteran of language study I'd never used it—and was highly skeptical. However, having memorized 20 animal names *and* their genders after 10 minutes with the German version of Gruneberg's **Linkword Language Series**, I was completely converted. It was so satisfying to learn so quickly that I had to tear myself from the computer when it was time to stop.

The Linkword series is also available in French, Italian and Spanish. Promised soon are Russian, Portugese and Greek versions. Words are introduced one at a time, with the computer giving the English word, foreign equivalent, phonetic spelling and quick image to keep in mind for each. As with the trout example, the images are often bizarre but usually effective.

Product Reviews

After 10 words, the program quizzes you. Then you use the same technique to learn the genders, and take another quiz.

Far from being a simple vocabulary program, Linkword also teaches the beginning elements of grammar. These sections were less impressive, however. The program introduces grammar in a "this means that" manner, rather than fully explaining concepts such as verb conjugation and noun declension. For example, the program tells you that the German word for *are* is *sind*, except when using the informal form of *you*, in which case it's *bist*. Mainstream foreign language texts almost always teach these verbs with a table of the pronouns and their corresponding verb forms.

The course covers such topics as dining out and going to the doctor, and teaches vocabulary ranging from clothes and furniture to business and travel. Parts of speech such as verbs and adjectives are interspersed, as is the grammar, throughout the 10 lessons.

At the end of each lesson, you must translate complete sentences. These exercises increase in complexity as you learn more grammar. The sentences incorporate words from previous lessons, thus reinforcing your vocabulary.

The program comes with an audio cassette featuring a native speaker pronouncing the words you've just learned. The audio section is optional, but I found it a very good supplement.

My main complaints with the program concern the drills. The sentence

translations at the end of each lesson were good practice, but at times I thought there should have been more of them. You can't repeat these drills without going through the entire lesson again.

The main problem, however, is that the program doesn't keep track of the words you miss. Even though words from previous lessons are repeated throughout, there is no way to add special emphasis on trouble spots. You also can't add your own vocabulary words, which makes it impossible for educators to customize lessons.

Because the program is easy to use, the short manual tells you only what you need to know to begin. The manual also has a complete glossary of the words in the course and even includes a short section on helping your child learn a language. However, the contents of the lessons aren't fully indexed. For example, if you want to go back and repeat the lesson on telling time, the manual doesn't tell you that it's buried in the restaurant section.

The program is geared toward home use, and constant interaction with the computer makes it more active than the book-and-cassette home language courses available. Although I thought the grammar lessons weren't very well presented, the speed with which vocabulary can be memorized made up for it. The package boasts that you will learn a vocabulary of 400 words in 10 hours—and if you're serious about learning a foreign language, don't balk at the claim. With Gruneberg's Linkword method and a little dedication, you'll be ready that European vacation for in no time.

ULTRA-SPEED, ULTRA MENU

For XL/XE (except 1200XL)
Ultra Menu/DOS: \$29.95
Ultra-Speed: \$49.95

CIRCLE 151 ON READER SERVICE CARD

Reviewed by Charles Cherry

Ultra-Speed, a replacement operating system chip for XL/XE computers, is designed to work with most 8-bit disk drive modifications to provide high-speed disk access with virtually all software.

Your keyboard speed is doubled—a real blessing for many programs. You now have all 40 screen columns to work with, and the colors have been changed slightly for more contrast. The [OPTION] key must now be held down for BASIC while booting. Pressing [HELP] and [RESET] produces a true coldstart—the same as turning the computer off and back on. This is invaluable with expanded memory because it doesn't erase the RAMdisk.

The chip has a piggyback socket and switch soldered to it, which lets you switch between the normal operating system and Ultra-Speed. To install the Ultra-Speed chip, you pull out the Atari operating system chip, plug in the Ultra-Speed and plug the operating system chip into the piggyback socket. The switch reaches to the back of the computer, where you drill a hole and mount it. (Take care to protect these fragile parts from static electricity and physical damage. And of course, opening up the case of your Atari voids the warranty.)

If your Atari's operating system chip happens to be soldered in place, the procedure becomes much harder. Desoldering the operating system chip is not a trivial operation. Overheating any of the 28 pins will destroy the

Navarone Introduces the *ST SCAN Image Scanner*[™] for Your ATARI ST System!

**The flexibility
to introduce
art into
desktop
publishing.**

With the *ST SCAN Image Scanner* you can transfer your line art, photographs, logos, diagrams, text, and other graphics into your computer.

Capture your *image* sharp and clear with resolutions up to 300 dots per inch and with 32 shades of grey.

Navarone's high speed interface.

Navarone combines the Canon IX-12 Image Scanner with its own High Speed Interface that plugs into the cartridge port of the Atari ST.

Sophisticated software is provided to allow scanning in both line art mode and halftone mode. The *ST SCAN Image Scanner* program is very easy to use and operates under GEM with simple click-on menu selections.

**It takes
less
than 15
seconds**

to scan in your *image*. Once digitized, you can use graphic programs like the DEGAS[™] to edit, crop, size, or shape your *image*.

You can put your *image* into final documents with Publishing Partner[™] or save in PostScript[™] to allow direct printing on postscript devices, such as, the Apple LaserWriter[™] or QMS PS 800[™].

**Compatibility with
graphic programs:**

Fleet Street Publisher[™]
by Mirror Soft,
Publishing Partner[™]
by Softlogik,
Easy Draw[™]
by MiGraph,
or DEGAS[™]
by Batteries Included.

**The ST SCAN
Image Scanner
Services are now
available at your
local Atari Dealer.**

Some Atari Dealers now offer Image Scanning Services. Contact the dealer nearest you for details about this Service.

**ST SCAN Image Scanner
is the most powerful and
versatile, high resolution
scanner available for
the Atari ST
Computer!**

The *ST SCAN Image Scanner* comes complete with scanner, interface, cable, and software for only:

continued from page 13

chip, and overheating the traces on the circuit board can also damage it. Fortunately, C.S.S. will install the chip for you for free—and within 24 hours. I strongly recommend taking advantage of this service.

Of course, there are always problems when you change an operating system. Some programs may not work with the Ultra-Speed. For example, the international character set has been deleted to make room for the Ultra-Speed handlers, and programs that use international characters won't work.

Ultra-Speed generally requires that disks must be formatted with the Ultra-Speed chip itself, meaning that you can't speed up the loading of protected disks although you may be able to speed up data disks.

Now that I have Ultra-Speed, I wonder how I got along without it. If you have a modified disk drive (especially if you also have a large RAMdisk), Ultra-Speed is a necessity. Even if you don't have any souped-up hardware, Ultra-Speed is useful. The enhancements may seem minor, but they greatly increase the pleasure of computing with the 8-bit Atari.

Ultra Menu/DOS provides easy access to many DOS functions. However, it has a curiously unfinished feel. It doesn't stay in memory while you run a program, so you must reboot it constantly. It's smart enough to know the difference between BASIC and machine language programs, but it crashes if it tries to load a text file as a BASIC program. It supports only four drives and no RAMdisk, but is compatible with many machine language programs.

Ultra Menu is at its best when copying files. You don't need to type the filename, just pick it from the directory. You can have auto-formatting and multiple copies, and you can copy between single-density and double-density. The DUP DISK com-

mand does a complete sector copy.

But even the copy utility is limited. There's no way to specify several files to copy, not even with wild cards (though you can specify all the files on a disk).

Ultra Menu's copy protection scheme is so bizarre that I can't let it pass without comment. The disk must have its write-protect tab re-

moved in order to run, which is just inviting trouble.

The program does not support high-speed transfers on modified drives, so you can't use it with the excellent Ultra-Speed operating system, which does. Still, Ultra-Menu/DOS has the makings of a useful product and I hope C.S.S. will develop it more fully. ■

Super Disk Bonus

Antic Spelling Checker

Speed-scan your writing

The Super Disk Bonus this month is Antic Spelling Checker. This fast, powerful machine language program makes it easy to handle as many as 10 personal dictionaries. It works with most DOS text files—such as AtariWriter, PaperClip, etc.

On an 8-bit Atari with 48K memory, you could have more than 6,300 words per dictionary (averaging five bytes per word). That adds up to over 63,000 words for the 10 dictionaries on your Antic Spelling Checker disk.

Antic Spelling Checker can create your new dictionaries by alphabetizing all the unique words in a text file and letting you edit the results. This is Antic's fourth monthly Super Disk Bonus—useful programs which are too

large or complex for publication as a type-in listing.

The Antic Spelling Checker program (PSC.EXE) and manual (HELP.BAS) are on Side B of the monthly disk. To read the instruction screens or make a printout, select choice 5 from the Side B menu. ■

Your \$5.95 Antic October Disk — featuring Antic Spelling Checker—could go in the mail to you today! Phone the Antic Disk Desk at (415) 957-0886 and use your Visa or Mastercard. ■

Now only \$5.95—Antic Monthly Disk!

Atari Animation

Lesson 5: Introducing Bit-Mapping

This series for intermediate BASIC programmers explains how to make Atari graphics move. But any 8-bit Atari user with minimum 32K memory, disk or cassette, can enjoy the short BASIC type-in graphics demonstrations accompanying each lesson.

Everything you see onscreen, whether text or graphics, is represented at the lowest level by bits which turn on or off. Each memory location in RAM can hold a number from 0 to 255. These numbers are stored by bits numbered 0 to 7 in each memory location. To create text and graphics onscreen, the computer's designers built programs into the computer telling it how to interpret those bits.

GRAPHICS 8

Graphics 8 is easier to understand than other graphic

modes. The screen is divided into a grid of 320 dots across and 192 dots down. Each dot can be turned on or off. In Graphics 8, each bit in screen memory represents a dot. Turn a bit on or off, and the corresponding dot responds exactly the same way.

Because each byte has eight bits and each line is 320 dots across, it follows that each Graphics 8 line contains 40 bytes. That's a total of 7,680 bytes of screen memory (40×192).

Since one byte holds eight dots instead of one, turning individual bits on and off can be frustrating (especially from BASIC). Another complication is color. You have a choice of two—on or off, 0 or 1, blue or white, background or foreground.

Giving a bit a value of 1 turns it on, and 0 turns it off. White is the foreground color—in which the letters are drawn in BASIC—and blue is the background color.

In BASIC, if we forget to set colors, then the machine uses built-in defaults—in this case, blue for background and white for foreground. To change these colors, either use the SETCOLOR command or POKE colors directly into the memory locations that hold the color information. Rarely will you want to change all of this directly. It's much easier to PLOT and DRAWTO.

GRAPHICS MODE SUMMARIES

DISPLAY TYPE	SCREEN SIZE (COLUMNS×ROWS)	MEMORY USED (BYTES)	DEFAULT COLORS	SET COLORS (N)	POKE ADDRESS	COLOR (N)
TWO SHADES OF ONE COLOR						
GRAPHICS 8	320×160 SPLIT 320×192 FULL	8112 SPLIT 8138 FULL	LIGHT BLUE	1	709	1
			DARK BLUE	2	710	0
			BLACK	4	712	BORDER
TWO COLORS						
GRAPHICS 4	80×40 SPLIT 80×48 FULL	MODE 4 694 SPLIT 696 FULL	ORANGE	0	708	1
GRAPHICS 6	160×80 SPLIT 160×96 FULL	MODE 6 2174 SPLIT 2184 FULL	BLACK	4	712	0
FOUR COLORS						
GRAPHICS 3	40×20 SPLIT 40×24 FULL	434 SPLIT 432 FULL	ORANGE	0	708	1
GRAPHICS 5	80×40 SPLIT 80×48 FULL	1174 SPLIT 1176 FULL	LIGHT GREEN	1	709	2
			BLUE	2	710	3
GRAPHICS 7	160×80 SPLIT 160×96 FULL	4190 SPLIT 4200 FULL	BLACK	4	712	0

GRAPHICS 4 AND 6

As in Graphics 8, the dots in Graphics 4 and 6 can be either on or off. The difference is the larger sizes of dots in GR. 4 and 6. Screen memory in these modes works

the same way as in GR. 8, but there can be fewer of those big GR. 4 and 6 dots onscreen. Thus less screen memory is needed, which gives you more room for your program and data.

GRAPHICS 3,5 AND 7

In these Graphics modes, not only can the pixels be on, but they each can have one of three colors—meaning *four* possibilities per pixel, not just two. But the catch is that we use *two* bits per pixel instead of one. So in the four-color modes, each byte of screen memory holds four dots instead of eight. Here's how they can be arranged:

BIT PATTERN	USES COLOR
00	0
01	1
10	2
11	3

These two bits tell your Atari chip which color to give a particular dot, but how does it know what the four colors are? After all, the Atari has 256 of them to choose from. As in Graphics 1 and 2, we use the four color registers. The difference, however, is that the bit combinations don't refer to the same color registers as they did for the characters.

BITS	REGISTER	LOCATION
00	background	712
01	0	708
02	1	709
03	2	710

BIT MAPPING

Now we are ready to explore what can be done with bit-mapped graphics modes.

You have seen that computer graphics is essentially getting bits turned on and off in the right places. Depending on the graphics mode you choose, these bits will be "translated" to the screen as pixels of varying sizes and color.

The only practical use for straight BASIC in drawing and PLOtting is to create backgrounds. We want to create shapes and make them flow gracefully enough to appear lifelike. We can either move our background—a city, mountains, etc.—or our players—cars, spaceships, people, etc. But you can animate any of these faster and more powerfully from BASIC with machine language sub-routines.

Another approach to animation uses the PLOT command. To get the effect of movement with this method,

you must PLOT a point, erase it, PLOT it again one place over, erase it and so on. The following program draws an orange dot that you can move with the joystick.

```

1000 REM ATARI ANIMATION, LESSON 5,
      DOT.BAS, PART 1
1010 REM BY ROBIN SHERER
1020 REM ©1987, ANTIC PUBLISHING ...
...
1030 GRAPHICS 4:POKE 764,255
1040 V=STICK(0)
1050 SETCOLOR 2,0,0:COLOR 2
1060 Y=Y+(V=13)+(V=9)+(V=5)-(V=10)-(V=
14)-(V=6)
1070 X=X-(V=10)-(V=11)-(V=9)+(V=6)+(V=
7)+(V=5)
1080 IF X<1 THEN X=1
1090 IF X>79 THEN X=79
1100 IF Y<1 THEN Y=1
1110 IF Y>39 THEN Y=39
1120 COLOR 1:PLOT X,Y:IF PEEK(764)=255
      THEN 1040
  
```

In this first example program, the dot leaves a trail—we're not so much animating as drawing. To get the desired effect, we must erase the trail by plotting the exact same shape using the background color in the same position once occupied by the orange dot. Below is a different method. Type it in as an addition to the previous lines.

```

10 REM ATARI ANIMATION, DOT, PART 2
1060 IF V=14 THEN Y=Y-1:PLOT X,Y+1
1065 IF V=13 THEN Y=Y+1:PLOT X,Y-1
1070 IF V=11 THEN X=X-1:PLOT X+1,Y
1075 IF V=7 THEN X=X+1:PLOT X-1,Y
  
```

"The most useful program for the Atari since Print Shop!"

FORMS GENERATOR

for the Atari 800, 800XL, 65XE, 130XE

Designed by Jeff Brenner, columnist for *Computer Shopper* magazine, of "Applying The Atari" fame, and author of book and magazine articles in *COMPUTE!*, *ANALOG* and others.

LOOK WHAT YOU CAN DO WITH FORMS GENERATOR: Purchase merchandise by mail? Next time, send a customized **purchase order form**! Does your home or business ever need **statements, invoices, proposals, job work orders, gift certificates**, etc.? No problem! Use **FORMS GENERATOR's** scrolling spreadsheet-style screen to design almost any form to suit your exact needs. What you see on-screen is what you get on paper! Use the text mode with any 80-column printer, or the high-res graphics mode with the Epson, Gemini/Star, Okidata, Panasonic or Prowriter for **remarkably realistic forms**. BUT THAT'S JUST THE BEGINNING: Once you've designed a form, you can program **FORMS GENERATOR** to make all calculations automatically! Imagine: after you enter quantities, descriptions and prices, **FORMS GENERATOR** moves about the form calculating extended prices, subtotals, and even the sales tax! Like magic! (Sample invoices included). You can also use **FORMS GENERATOR** for record keeping, since you can save filled forms to disk!

Read what our customers have written: "Excellent... easy to use and ran perfect (ly)..." T.W. Wethersfield, Connecticut; "I was most impressed with your FORMS GENERATOR program..." J.E. King, South Carolina; "Love it!" C.R. Cortland, Ohio. Our "down to planet Earth" price: Only \$23.95 (product #ATA611).

The difference between the two dot routines is subtle, but important. It lies in the way the programs use the X and Y variables.

In the first example, X and Y contain the *current* position of the dot. In the second example, X and Y contain the *previous* position of the dot. And if we know the previous position of the dot, we can erase its trail.

Also, you can only move the joystick horizontally or vertically. To move it diagonally, you'd need several more program lines.

PLOTTing can be tedious, especially if you have a lot of points to plot. Here's an example:

Even this takes a while to draw. Fortunately we already saw that using character sets was much quicker and gave an almost cartoon-like quality to the shape. But bit-mapped Graphics modes *can* be used for nice backgrounds.

ORIGINAL SCREEN

BIT-MAPPED MODES

The best way to use a graphics mode in a program is to use a graphics editor to draw the entire screen, then SAVE it to disk. When your program needs that screen, you can bring up the data quickly and place it right into the correct memory area for screen data.

The idea of moving characters around the screen isn't much different from cutting and pasting paper shapes. First you must define a set of dots, then instruct the computer with a machine language routine to move all dots between, for example, screen coordinates 10,10 and 20,20.

Great, but what if the "box" we placed our picture in

MAN ERASES PART OF TREE. TREE MUST BE REDRAWN.

HOLE WHERE MAN WAS. MUST FILL WITH BACKGROUND COLOR.

had part of another shape in it? Then you must tell the computer, via another machine language routine, to put those dots at a different location. The only practical way to cut out a shape is with a box that surrounds it. Fill any holes with background color.

The disadvantages of animating with memory move routines are subtle. If part of your picture resides outside the area you have moved, that portion will stay put. Also, the area that is moved will overwrite everything in the area where it's placed.

The only solution would be to write a complicated machine language routine to store the picture we're cutting out before the shape messes it up, then restore it after the shape moves across the background. Since this must be done for each pixel in the "box," it can be very complicated.

However, the best way to animate small shapes is with

Player/Missile graphics—which will be introduced in later lessons.

GRAPHICS MODE TEXT

Adding text to Graphics modes is handy for everything from game scores to business chart labels. The following examples look at the character set in RAM, take apart the bits for the desired letters, and “paint” them onto your graphics screen.

```
2 REM M8TXT.BAS
4 REM BY ROBIN SHERER
6 REM ©1987, ANTIC PUBLISHING
10 DIM TEXT$(4),HOLD$(1)
20 TEXT$="TEST":X=5:Y=20:REM (CHANGE T
0 Y=10 FOR GR.4)
30 GRAPHICS 8+16:SAVMSC=PEEK(88)+PEEK(
89)*256:WIDTH=40
40 POKE 710,0
50 SCRN=SAVMSC+Y*WIDTH+X
60 FOR Z=1 TO LEN(TEXT$)
70 HOLD$=TEXT$(Z,Z):GOSUB 140
80 CHAR=PEEK(756)*256+TEMP*8
90 FOR ROW=0 TO 7
100 POKE SCRN+ROW*WIDTH,PEEK(CHAR+ROW)

110 NEXT ROW:SCRN=SCRN+1:NEXT Z
120 COLOR 1:PLOT 10,10:DRAWTO 40,40
130 GOTO 130
140 TEMP=ASC(HOLD$):IF TEMP>127 THEN T
EMP=TEMP-128
150 IF TEMP>31 AND TEMP<96 THEN TEMP=T
EMP-32:RETURN
160 IF TEMP<32 THEN TEMP=TEMP+64
170 RETURN
```

Line 20 contains the string you want to plot, and the X,Y position to place it in. Remember to use the same limits as the Graphics modes you're in.

Line 30 finds the start of screen memory and places this address into SAVMSC.

Line 40 sets the background color.

Line 50 calculates where to start placing data in the screen memory.

Lines 60-70 and the useful subroutine at 140-170 break down the characters to their position internally in the Atari's ROM character set. If internal codes matched ASCII codes, this wouldn't be needed.

Line 80 checks the Character Base Register (location 756, \$02F4) to find the start of the character set. This routine will work with your own redefined character sets, too. (See Lesson 3, Antic, Aug. '87, for more information on redefined character sets.)

Lines 90-110 break down the eight horizontal “layers” of the character and POKE it directly into memory.

Line 120 plots a line to show you we aren't faking anything. Your screen really has letters and graphics overlapped.

To change the routine for Graphics 4 or 6, change the Graphics mode number (line 30) from 8 to 6 (or 4). Then, change NUMCOL (line 30) from 40 to 20 (for Graphics 6) or 10 (for Graphics 4). If you're using Graphics 4, you'll also have to change the instruction Y=20 to Y=10 in line 20.

FLAPPING BIRD

This month's demonstration listing combines the short routines from the article. It draws a flapping bird which you can control with your joystick. It is a very simple, bare-bones example that you'll find easy to understand and modify.

Type in Listing 1, VBIRD.BAS, checking it with TYPO II, and SAVE a copy to disk before you RUN it. When RUN, VBIRD draws a simple mountain scene in Graphics 8. Then, the listing uses routines from M8TXT.BAS to successively plot the “v”, “^” and “ ” characters, giving the illusion of a flapping bird. We've also borrowed the animation routines from the DOT routines to allow you to move the flapping bird up and down. ■

RECOMMENDED BOOKS

Your Atari Computer by Lon Poole. Osborne/McGraw-Hill, 2600 Tenth Street, Berkeley, CA 94710. (415) 548-2805. \$17.95, 474 pages.

Mapping the Atari by Ian Chadwick. Compute! Publications, Inc. (ABC), 825 Seventh Avenue, New York, NY 10019. (212) 887-5928. \$16.95, 272 pages.

Robin Sherer co-wrote four Atari programming books. He presently programs for Boeing in Seattle.

Resistors

Action game teaches binary and electronics

It's not easy to be an electron and take care of your business on a challenging circuit board. Enter the world of Resistors and see for yourself. This BASIC program works on any 8-bit Atari computer with a minimum 48K memory, disk or cassette.

Here is your chance to play the role of a charged-up electron on a challenging journey through a vast, complex circuit board. Resistors won't exactly teach you the fundamentals of electronics. But it does convey an overall sense of how the various elements of a circuit work together—as well as giving you practice in converting binary numbers to decimal. And the game is a lot of fun to play.

During your travels through this scrolling circuit, you'll contact a variety of resistors, diodes and capacitors. As an electron, your job is to match the target number displayed at the bottom of the screen. This is done by charging the correct combination of diodes—each of which contains a different binary number. All charged diode numbers are added together and automatically converted to their decimal equivalent. This sum is displayed at the bottom right of the screen. If you can form the correct target number, your job is complete and it's on to the next round.

To get on the circuit, type in Listing 1, RESISTOR.BAS, check it with TYPO II and SAVE a copy before you RUN it.

If you have trouble typing the special characters in lines 1005 and 19010, don't type them in. Listing 2 will create

Figure 1

DIODE	VALUE	BINARY VALUE	DECIMAL VALUE
7	2^7	10000000	128
6	2^6	01000000	64
5	2^5	00100000	32
4	2^4	00010000	16
3	2^3	00001000	8
2	2^2	00000100	4
2	2^1	00000010	2
2	2^0	00000001	1

them for you. Type in Listing 2, check it with TYPO II, and SAVE a copy. When you RUN Listing 2, it creates these hard-to-type lines and stores them in a disk file called LINES.LST.

To merge the two programs, disk users LOAD "D:RESISTOR.BAS" and then ENTER "D:LINES.LST". Remember to SAVE the completed program before you RUN it.

Cassette users: Follow the onscreen prompts after you RUN Listing 2.

GAME PLAY

At the start of each round, a random decimal number from 1 to 255 is displayed in the lower left corner of the screen. The circuit board is then "soldered" with random placement of the various resistors, diodes and capacitors. The complete circuit is made up of 10 rows and 12 columns, but only a small portion of this can be seen at one time.

You'll start each round at a random location in the top row. To move around the circuit, simply press your joystick up for north, down for south, left for west, or right for east. You cannot move diagonally.

There are four different types of resistors, each marked with a specific number number of vertical lines—zero, one, two or three. Each type of resistor blocks your electron from moving in *one* of the four possible directions.

MARKINGS	OPEN	BLOCKED
0 LINES	N, S, W	E
1 LINE	S, W, E	N
2 LINES	N, W, E	S
3 LINES	N, S, E	W

To make your journey a little more challenging, the circuit constantly changes. Every time you leave a resistor, it randomly converts to a different type. Sometimes this works to your advantage by opening up a blocked pathway. At other times it could block your path. Once inside a resistor, you won't be able to see its markings. If you can't remember what type you're in, press your joystick button and the markings will become visible for a few seconds.

DIODES

There are eight different types of diodes and only one of each type. They are marked by the numbers 0 to 7. These numbers indicate the charge that each diode holds—expressed as a power of two! The diode marked by a 7, for example, contains a charge of 27, or 128 (10000000 in binary).

For example, to match a target number of 170 (or 10101010 in binary), you'd have to discharge diodes numbered 7, 5, 3 and 1. *Figure 1* will help you remember the value of each diode.

The diodes can be in a charged or uncharged state. They are always uncharged at the start of each round. When you move to an uncharged diode, it becomes charged. The binary number it holds (indicated by its markings) is transmitted to a microprocessor and automatically converted to its decimal equivalent. It is then added to your

total and displayed in the lower right corner.

In contrast, if you move to a diode that's already charged, the number it holds will automatically be subtracted from your

total. The diode will then lose its charge. The seven vertical indicator lights beneath the circuit show the present state of each diode. A charged diode is solid and an uncharged one is hollow.

It should now be apparent why the target number can only go up to 255. If you charge all the diodes and add up their decimal equivalents, you get 255. Depending on the combination of diodes charged, you can form any number from 1 to 255.

CAPACITORS

You electrons don't have an endless supply of energy. You start each round with 99 watts. Every time you attempt to move, even if that direction is blocked, you'll use up one watt. You can increase your wattage by moving to a capacitor.

A capacitor is hollow and contains no markings. You'll start each game with nine capacitors, decreasing by one with each successive round until you only have one left. Once you enter a capacitor, you have the potential to gain as many as 20 watts. This is because the maximum wattage our electron can hold is 99. After a capacitor is discharged, it turns into a resistor.

SCORING

You'll receive one point for every watt remaining after you complete your assigned target number. So the less energy you use, the higher your score. You start each game with three electron lives and lose one every time your charge drops to zero.

To get high scores, you must remember the directions blocked by each type of resistor. You'll also need a good understanding of binary numbers and how to convert them to decimal. So if you don't already understand binary/decimal conversions when you start playing Resistors, this game will give you some valuable practice.

PROGRAM TAKE-APART

5-10	Start-up routines.
20-90	Various subroutines.
105-160	Reads the joystick for direction of move.
170-200	Moves the electron.
255-285	Finds resistor value, adds it to total and checks for a win.
300-330	Increases wattage for being in a diode.
500-515	Wattage is zero, deletes one electron and checks for end of game.
525-545	Game over subroutine.
1000-1025	Correct answer, increases score and generates new circuit.
19000-25042	Redefines character set.
26000-26035	Draws main screen.
26050-26100	Initializes variables, picks target number and starting position.
26300-26320	Setup scrolling routine.
26399-26440	Setup circuit board.
26515-26660	Randomly plots resistors, diodes and capacitors
31000-31040	Title screen.

Chuck Rosko, 29, is a microbiologist from Pittsburgh, Pennsylvania. He has been programming in Atari BASIC and machine language for five years, specializing in educational games.

\$5 per hour

Most online information networks can drain your resources faster than you can say "Vampire." Not with GENie, the General Electric Network for Information Exchange. As part of the world's largest commercially available teleprocessing network of General Electric Information Services Company, GENie won't bite into your budget.

**Evenings, weekends, holidays.
Just \$5 per hour.**

With GENie, you can make friends, schedule meetings, gather facts and figures, set up travel reservations, get the news, be entertained, even shop for a fraction of what other information services charge.

And you get a lot more for your money.

With GENie's Atari† **RoundTable™** **Special Interest Group** you can discuss the latest in Atari products and accessories; download hundreds of public domain software programs, and participate in exciting and informative online conferences. And, uploads are FREE on GENie!

There's more!

Meet friends old and new with GENie's **LiveWire™** CB simulator or exchange messages with **electronic mail** service. Schedule a trip with the **online travel service**. Fun and learning for the whole family with **Grolier's** electronic encyclopedia.

Play multiplayer and classic games in GENie's **Game Room**. Get the latest in domestic and international **computing news**. All this and there's more to come. New services are being added each and every month!

Only \$18 to register! Save up to 60%!

Check out the chart. Compare the savings for yourself. You'll find GENie delivers all of your favorite services for an incomparable price, at incomparable savings.

Compare & Save*	Services						Pricing			
	Travel & Shopping	SIGs/User Groups	CB & Mail	Financial Services	News	Games	Registration Fee	Monthly Minimum	Non-prime time rates	
									300 baud	1200 baud
The Source	X	X	X	X	X	X	\$49.95	\$10.00	\$8.40	\$10.80
CompuServe	X	X	X	X	X	X	\$39.95	none	\$6.00	\$12.50

ACENET Boosts User Power

17 SoCal groups join forces

The first Atari Fair probably would not have happened in September 1986 at the Glendale Civic Auditorium, if not for ACENET—the consortium of 17 Southern California users groups between Santa Barbara, San Diego, Riverside and Long Beach. A 1987 Southern California Atari Fair is now scheduled for September 19-20 at the Glendale Civic.

ACENET first met in September, 1985. Its president is John King Tarpinian, a gregarious IRS agent who is also the president of the Hooked On Atari Computer Keyboard Society (HACKS) in North Hollywood. The ACENET officers meet approximately every three months.

Tarpinian had written to Atari Chairman Jack Tramiel about the possibility of a fair. After Atari Users Group Coordinator Sandi Austin called to tell the HACKS president that Tramiel says yes, Tarpinian met with Atari executives including Jack Tramiel; Sig Hartmann, Executive Vice President of Business Development; and Neil Harris, Marketing Communications Director.

Atari put up the front money for the convention hall and other major expenses, and ACENET was to repay them from the profits. If the show lost money, the groups would not owe Atari anything. "It worked beautifully," says Tarpinian.

At the April 1987 West Coast Computer Fair in San Francisco, ACENET demonstrated several current products at its booth, including the QMI laser printer and the BTL hard disk (reviewed in *Antic*, April 1987).

"ACENET got started because the competition between various clubs here became detrimental for no good rea-

son," says Tarpinian. "It turned out that individual clubs regularly shared members. In fact, probably 20% of ACENET members belong to at least two clubs. So now each club tells its members about other nearby clubs. Some-

where down the line we plan to take the 'best-of' articles from all the individual club newsletters and produce a quarterly magazine."

HACKS' phone number is the same as ACENET's. Tarpinian's best "guesstimate" is that ACENET has about 5,000 members. Some clubs count individual memberships and others count family memberships. Membership numbers range between 60 and 300. There's no one huge users group in the greater Southern California area.

The original 11 clubs in the consortium have almost doubled in size since the beginning. "We hadn't found the other clubs yet," says Tarpinian, "and some even thought they were too small to be included in ACENET. They didn't know what we were about." Few clubs in the area don't belong to ACENET now.

ACENET has more white-collar workers than blue-collar workers, says Tarpinian. "I've got three or four chiropractors. Two members are computer company marketing reps who actually sell other brands of computers." Most members are in their late 20s or early 30s.

ST users make up 90% of the new members. "Most clubs have 8-bit and ST SIGS," says Tarpinian. "Some have programming

SIGS. We're compiling a 40-page 'Introduction to Your Atari' booklet. Each club will get a master to copy for their new members."

continued on next page

HACKS

The HACKS 8-bit SIG has a 6502 programming class taught by Mark Manyen of Software Toolworks, who wrote *Golden Oldies* (reviewed in *Antic*, May 1987).

The HACKS newsletter is eight pages long. Its editor, club vice president Kitts Anderson, finds the material for the articles at the meetings. Then another member, Lew Marchese, "who just happens to own the largest graphics/art shop in Los Angeles, does all the paste-up and typesetting for free," says Tarpinian. "So we can afford to have it offset-print on a heavier bond paper. People really notice the newsletter because it looks so good. I send a copy to about 300 manufacturers every three months.

ACENET itself does not have a BBS, but most of the clubs do. HACKS' official systems are Magic Castle for the 8-bit, run by Dave Evans—which is where you'll often find Robert Jung (*A-Rogue*, *Antic*, May 1987)—and Infinity for the ST. And another BBS, ST Jungle, has been added. Officers from the other clubs have access to all three.

The Infinity BBS, run by Mark Krynsky, is supported jointly by ACENET and Logical Choice, an Atari-only store in North Hollywood. "We have a symbiotic relationship with that store," says Tarpinian.

HACKS SURVEY

About 70 of HACKS' 160 members attend the general meetings. Most ACENET clubs get about 40% attendance at meetings, according to Tarpinian. HACKS membership has increased about 5% a month—that's a net increase, taking into account the attrition rate.

"I'd say that the HACKS membership is 45% ST, 55% 8-bit, with about 20% having both," says Tarpinian. "At the Atari Fair, 2/3 of the attendees were 8-bit users. The vendors discounted the software a little, and the people were delighted. When the 8-biters saw a decent selection for a change, they went nuts with their credit cards. The retailers were tickled pink."

Only about 10% of HACKS members use hard disks, mostly because of the prices. Everyone else uses floppy drives—Tarpinian says he doesn't know anyone who still uses cassettes.

The most popular floppy drive is the 1050, and the most popular printers are Epsoms and their clones. On the 8-bit, the 1030 and XM301 are the most popular modems, and the Avatex is the most popular on the ST.

The online services used most often are CompuServe and Genie. Bulletin board systems are probably used even more. "PC Pursuit has opened up a new world for people," says Tarpinian. "For a flat \$25 a month, they can call any public BBS in the nation. Those that have it swear by it, and I really think it's helped." (More details about about

PC Pursuit in this issue's Communications department.)

The main 8-bit programming languages are BASIC and assembly, and C is most widely used on the ST. About 25% percent of HACKS members are programmers, and about half have more than rudimentary programming knowledge. Perhaps 10% of HACKS members do hardware projects.

In order of importance, here's what HACKS members use their Ataris for:

1. Word Processing
2. Telecommunications
3. MIDI
4. Finance
5. Games
6. Education
7. Programming

"We have several members over 60 years old," says Tarpinian. "They do a lot of work with genealogy programs."

MIDI enthusiasts are prevalent too—several professional musicians live in the area. "There's a MIDI-only computer store down here called MIDI City," says Tarpinian. "For

MIDI, the Macintosh tended to be the machine of choice—for those with money. For the next level of musician, those who make a living at it but don't necessarily have money to burn, the ST is the one. Programs cost less for the ST, and the musicians don't have to buy so much add-on hardware.

"A musician named Charles Faris helps our MIDI SIG. Nobody's heard of him, but he has 87 gold albums and 35 platinum albums—he does all the in-house arranging for John Williams and George Lucas. Hybrid Arts, the makers of MIDImate, help us out too."

DEALING WITH ATARI

"I've had no problems with Atari—but I've learned that if you need something, you should phone them first and *then* send the request in writing. Then everything runs relatively smoothly," Tarpinian says.

Tarpinian deplores the lack of Atari software (especially 8-bit) in stores. "But at the fair, Logical Choice found out how rabid the 8-bit users are. They now keep at least 100 8-bit titles in their store."

PIRACY

"Someone once called me and said 'I'd like to buy a copy of FORTRAN,'" says Tarpinian. "I said, 'Well, we're a computer club, not a retail store.' 'No, no, no,' he says, 'I want to buy a *copy*.' I said, 'That's illegal.' He said, 'So?' I just hung up on him. First time I'd *ever* had someone do that."

That summarizes the basic feeling of HACKS—and ACENET in general—about software piracy. "Our club has

some CIA agents as members," says Tarpinian. "If you're caught pirating, you'll get booted out. But I've never had a problem at a club meeting. So many of our members make their living from the computer industry, and piracy does nothing but hurt it. The people who were 14 when they bought their first computers are 23 or 24 now, and they've grown up. I just get angry with copy protection because I can't put a protected program on my hard disk." ■

ATTENTION PROGRAMMERS!

Announcing the arrival of a new programming package... the ST SPRITE FACTORY from FUTURE SOFTWARE SYSTEMS. The ST SPRITE FACTORY is the first full featured professional sprite editing system of its kind. It includes an on-board animation routine, with joystick simulator. The ST SPRITE FACTORY helps you to create your own arcade-style games quickly & easily. The package allows you to:

- Use standard "DEGAS" * file format to save up to 60 sprites per file.
- Use simple mouse/menu driven commands to create sprites with advanced graphics features like: mirror, shrink, rotate, cut, paste, copy, insert, flip, fill, distort, and others.
- Use animation program to see what your sprites will look like animated and moving in any direction. (User defined at the click of a mouse button--up to 1000 frames!)
- Use the "mapmaker" to create a scrolling play field or maze for your sprites to run on.
- Choose any of 80 masking options to pass sprites in front of, behind, or through other objects.
- Includes source code and tutorials on how to move sprites, detect collisions, set object priorities, and more!

The ST SPRITE FACTORY from FUTURE SOFTWARE SYSTEMS is also compatible with the ANIMATOR from MICHTRON.

Stop dreaming and start programming an arcade game of your own today!

(206) 927-7018
\$159.95, 48K disk

CIRCLE 164 ON READER SERVICE CARD

With the **XR 100 Bar Code Reader** program, you can add the option of Code 39 bar code input (sometimes called "3 of 9") to most software—usually without having to modify the existing program. The XR was designed to be as compatible as possible with most existing languages and disk operating systems.

To accomplish this, the program is provided in two forms: **BARL.COM**, which automatically locates itself to the lowest available memory, and **BARH.COM**, which locates itself to the highest available memory. The program contains a digital "wand" which plugs into joystick port 1. (This isn't the type of wand that reads UPC symbols in grocery stores—those require a laser scanner. Code 39 is used by the Federal Government and large companies such as Lockheed.)

Return the favor. When you call a manufacturer or supplier about a product you've seen advertised or otherwise mentioned in ANTIC, please tell them so. This will help us to continue to bring you the latest information about products that will make your Atari computer an even more valuable investment in the future.

—ANTIC ED

Graphics Impossible

Antic imports Britain's best

Here are two eye-popping demonstrations of graphics techniques often mistakenly considered impossible—mixed vertical display lists, and dual players on the same horizontal line. You can use these powerful subroutines in your own BASIC programs and MAC/65 assembly language source code is also included. These BASIC program work on all 8-bit Atari computers of any memory size, with disk or cassette.

Any experienced 8-bit Atari user has learned that these computers are incredibly versatile. But there are some things most users believe the Atari can't do. For example, if you're a graphics programmer, you probably know that display lists can be mixed *horizontally* by building a new display list. But just ask some experts if you can combine different graphics modes *vertically* across the screen and they'll say it can't be done.

The two programs presented here will show that the Atari is even more versatile than some experts think.

Both of our programs use Graphics 8 because it's one of the most consistent graphics modes as far as direct memory access time (DMA) is concerned.

(DMA refers to the way the ANTIC chip "steals" cycles from the 6502 chip in order to draw the display screen. When you turn off the ANTIC chip with POKE 559,0 DMA is disabled and your program will run 15%-30% faster. However, your screen will be black. —ANTIC ED)

All Atari graphics modes are more DMA-consistent than text modes. In fact, every scan line uses the same amount of DMA time except the two

LMS (Load Memory Scan) lines—the first of which is two machine cycles ahead of a normal scan line while the second is three cycles ahead. We must take account of these differences in our timing loop.

GRAPHDEM

Our first listing, GRAPHDEM.BAS, proves that you *can* mix Graphics 8 and 9 vertically and there's no reason you can't change the program to include Graphics 10 or 11. So type in Listing 1, GRAPHDEM.BAS, check it with TYPO II and SAVE a copy before you RUN it.

This program generates a screen consisting of a Graphics 8 vertical margin down the left side, with the rest in Graphics 9. The normal four-line horizontal Graphics 0 text window is also retained. With this arrangement you can draw graphs in 16 intensities, neatly labeled with 40-column text.

The mix is created by changing the value in PRIOR (a GTIA mode selector, 53275, \$D01B) from 0 to 64. This is done at a particular point on every scan line. (If you have an older Atari, POKE 623,64 to see if your machine has the GTIA chip. If so, the screen will go black. —ANTIC ED) Every scan

line will take up 32 pixels of Graphics 8, with the rest of the screen in Graphics 9. We can access these from BASIC by fooling the operating system into thinking we're in either Graphics 8 or 9 (subroutines GR8 and GR9) and then DRAWing TO the relevant section of the screen.

The source code for the display list interrupt (DLI) used is in Listing 2, GRAPHDLI.M65. You do *not* need to type in this listing in order to use the program. This source code is provided just for the information of machine language students.

By increasing or decreasing the DELAY between changes to PRIOR, we can change the proportions in which the screen is split between the two modes. You can create graphs such as pie charts, etc., while graphics adventures could be drawn in Graphics 9 with text or status information down the side in Graphics 8. There are many other applications requiring such labels.

What about doing the same thing with the ANTIC chip by changing a single scan line between the ANTIC E and ANTIC F display mode? According to standard reference manuals—and my own unsuccessful experiments—it's not possible because ANTIC's Display List Instruction Register (IR) cannot be accessed directly by the programmer.

PLAYDEM

The classic guidebook *De Re Atari* says that no two sections of the player can be on the same horizontal line. Therefore two incarnations (copies) of the player cannot be on the same horizontal line. This is incorrect, as Listing 3 will show. Type in Listing 3, PLAYDEM.BAS, check it with TYPO II and SAVE a copy before you RUN it.

Antic proudly commences an important new "program exchange" series. During coming months, we will regularly reprint outstanding programs which originally appeared in England's leading Atari Magazine, Page 6. This recent exchange agreement gives Atari users on both sides of the Atlantic a much larger base of fine programming to enjoy, because Page 6 will also be reprinting Antic's top programs for the British public.

The scan line timing waits until the first incarnation has been displayed before moving the players horizontally. This technique could be extended to all players quite easily by using NOPs (No Operation) assembly language instructions which tell your Atari to do nothing for two machine cycles within the timing loop.

You could also change **PMBASE** (Player/Missile Base Address, 54279, \$D407) as well, thus having completely independent incarnations of each player as long as they're within certain screen bounds.

To position these incarnations of Player 0, their horizontal positions should be stored in locations 203 and 204 respectively. The program also displays all other players and missiles to prove that there is no cheating.

This is obviously a very powerful technique, and it's feasible that in games such as Pac-Man we could generate all the ghosts from just one player.

****FLASH:** You don't need to type the weekly NFL 1987-88 statistics required by Football Predictor. Log onto ANTIC ONLINE on CompuServe for instructions about how to download these figures, as well as Football Predictor's latest '87-88 success percentage.

FOOTBALL PREDICTOR

Beat the Vegas spread on NFL winners

Beat the Las Vegas oddsmakers by picking the winning pro football point spreads with your Atari! Football Predictor had an impressive 59.6% season for 1986. This BASIC program works on Atari 8-bit computers with at least 32K memory and a disk drive.

IS IT REALLY POSSIBLE FOR YOUR ATARI to outguess the Las Vegas pro football oddsmakers? We think so, thanks to Football Predictor. For the National Football League's 1986 regular season, this Atari 8-bit program outguessed the official Las Vegas point spread 53 times versus 36 losses—a winning percentage of 59.6% *against the spread*.

According to scholars of gambling lore, any method that wins more than 58% is considered successful. In other words, if you managed your cash sensibly you could have made money betting with Football Predictor during the overall 1986 regular NFL season.

(Of course, the past successes of any prediction method don't guarantee future success. The authors and Antic Publishing disclaim all responsibility for whatever betting risks you may choose to take. —ANTIC ED)

Football Predictor's 59.6% success rate for 1986 is particularly impressive because it relies on a single statistical relationship and requires you to make minimal data entry for its predictions. Just enter each NFL game's net passing yardage, net rushing yardage, and points scored both for and against each team.

You can get these required statistics from the sports section of your local newspaper. Allow about 45 minutes each week for data entry.

continued on next page

● BY BILL MARQUARDT AND DAVID COWLES ●

GETTING STARTED

Type in Listing 1, FPRED.BAS, check it with TYPO II and SAVE a copy before you RUN it. (The program is long, but none of the lines are especially hard to type.) Then join most other Americans in waiting impatiently for the first week of the pro football season.

Football Predictor covers all 28 current teams in the National Football League. But it could easily be modified to include any future expansion teams. Just change the variable T in line 110 to the new number of teams, then add the new team names to the DATA statements at the bottom of the listing.

Keep your working copy of the program on its own disk with only the DOS.SYS and DUP.SYS files for company. Leave the disk in drive 1 when you use it, because the program accesses the drive often. As the season progresses, 18 more files will be added to the disk.

MAIN MENU CHOICES

The following discussion of the main menu selections will lead you through the operations of Football Predictor.

• 1—ENTER STATISTICS

Choose this after you assemble all the required data from your sports pages. One at a time, Football Predictor will ask you for each item. After you type the last item, the program makes a data file for that week, updating both the season totals and week number files. We strongly suggest backing up your disk each week.

• 2—PREDICT SCORES

After typing at least one week's statistics, make your predictions with option 2. The screen changes, showing the game number, and displays your choices in the top half of the screen. On the bottom half are lines labeled "Home Team" and "Visitor," with an arrow prompting for the requested information.

To finish your predictions, you'll need your sports pages' schedule of the following week's games and the

Las Vegas spread. Press [OPTION] until a home team appears, then press [SELECT]. Do the same for the visitor. The program will quickly predict a winner and a point spread. If you make a mistake, start over by pressing [ESCAPE]. After entering at least one matchup, pressing [START] prints your predicted scores.

To predict each game's outcome relative to the Las Vegas line, compare the program's predictions with the point spread in the newspaper. If the Predictor favors one team above the published spread by at least $4\frac{1}{2}$ points, select that team to *beat the spread*.

For instance, if the line favors the 49ers over the Redskins by 2 points but the Predictor favors them by $6\frac{1}{2}$ points, pick the 49ers to beat the spread. Likewise, if the line favors the Redskins by 2 but the Predictor favors the 49ers by $2\frac{1}{2}$, go with the 49ers again. This $4\frac{1}{2}$ point "fudge factor" was used to obtain our 59.6% success rate.

Not every game played can be predicted against the spread. Only consider betting on games having a significant edge. One week in 1986, all 14 of the Predictor's predictions were less than $4\frac{1}{2}$ points away from the Las Vegas line.

• 3—REVIEW WEEKLY STATS

Follow the prompts to print the statistics—either to the screen or the printer—for any or all teams during a given week. If you choose to revise incorrect statistics entered earlier, the program reads each week's data file for the season and recalculates the file showing the season totals. This tends to take a while.

• 4—REVIEW SEASON STATS

This item is similar to selection 3 except that it displays or prints totals for the season to date. Also, to revise the statistics directly, you must use selection 3 to correct any faulty data for the appropriate week(s).

• 5—QUIT

Just what it says: takes you back to the "READY" prompt.

HOW IT WORKS

Basically, the program calculates each team's average number of offensive and defensive yards per point and then divides the results by two. Our method differs from standard approaches by matching the two opposing teams directly against each other, instead of comparing each to a standard derived from the totals of all teams in the league.

No other factors are considered—not even home field advantage. So feel free to experiment: the program was written so as to be modified easily by any experienced BASIC programmer. If your modified version has a spectacularly successful 1987 season, send the modification to **Antic** to be considered for possible publication.

TELEPROMPTING WITH ATARI

Our favorite 8-bit cues the President

Mary Rhomberg Pelouin

By Gregg Pearlman, Antic Assistant Editor

W

henever you see people speaking on television and looking directly at the camera for more than about 20 seconds, chances are they're using a prompter. The glass plates you see in front of the President during his speeches are actually reflecting a computer/video monitor on the floor.

Q-Tv of Los Angeles uses Atari 130XE computers as the basis of its prompter system. The company has supplied prompters for 28 years and used Ataris for four, including an occasional 800 model. Q-Tv calls its system a video prompter or computer prompter. They don't use the better-known term, teleprompter (actually TelePrompter) because it's a registered trademark of Group W.

According to equipment supervisor and operator Jim Franz, Q-Tv's prompters are "direct-line descendants" of TelePrompter. Q-Tv and TelePrompter Inc. were competitors in the late 1950s. But Group W now owns the *name* "TelePrompter" — while Q-Tv owns the patents on the equipment.

"We supply prompters for commercials, business meetings—company presidents or CEOs giving the bad news to stockholders—political speeches, industrial films, religious broadcasts, award shows—you name it," says Franz. "We've

continued on next page

done everything from sitting on top of Mount St. Helens while it was erupting, to sitting on top of the San Andreas earthquake fault."

Q-TV does national as well as local commercials and programs. Commercials range from Ed McMahon and his sweepstakes to political messages from President Reagan. The company also supplies equipment for films and videos used by companies as in-house training films. Q-TV has also supplied Los Angeles mayor Tom Bradley and sold a system to California Governor George Deukmejian.

They work with custom software that has some word processing functions built in. But this system can also use AtariWriter files.

HOW IT WORKS

Here's the process:

1. The speech or script is sent to Q-TV.
2. Text is input to the Atari either by typing it from the hard copy or downloading it from an IBM, via a connecting cable that converts the file to something the Atari can understand. (This transfer is similar to **Antic's Linkline**, which transfers files between Atari 8-bit and ST computers.)
3. The Atari saves the speech to disk. There's also an 8K buffer. This normally takes two to five minutes.
4. Q-TV proofreads the speech,

**Q-TV has built
its prompter
systems around
the Atari
for four years**

Antic Prompter

Your next speech goes scrolling by

By Heidi Brumbaugh, **Antic** Junior Editor

*Not to be outdone by Q-TV's computer prompter, **Antic** brings you your own type-in prompter software for speeches or lectures given at users group meetings, classes, seminars, etc. This BASIC program works on all 8-bit Atari computers with 32K memory and a disk drive.*

If Q-TV (see story in this issue) can use 8-bit Atari computers to run professional video prompting setups, then it stands to reason that **Antic** programmers can write type-in programs that will enable your own 8-bit—or ST—to function as a full-featured video prompting system.

Just think how great it will be to have a video prompter for all those presentations you and your friends need to make at users group meetings, classes, seminars, etc. In fact, this could be your opportunity to start a part-time video prompting business in your hometown.

START PROMPTING

If you're an 8-bit user, type in Listing 1, PROMPTER.BAS, check it with TYPO II and SAVE a copy before you RUN it. (ST users will find the 16-bit version of this program in this issue's ST Resource section.)

Antic Prompter's opening screen demonstrates the program's scrolling ability while telling you how

to use the joystick to control the speed and direction of your scrolling text. Pressing any console key—such as [OPTION], [START], etc.—brings up the main menu.

If you already typed in your speech using a word processor such as AtariWriter or PaperClip—but not Letter Perfect—select [3] (Load File) from the menu. Then type the file name and select [4] (Use Teleprompter).

To create a new text file, choose option [1], Screen Editor. This bare-bones text editor only lets you enter a single screen of text at one time, but later we'll explain how you can merge multiple screens into a larger file.

Use [CONTROL]-[ARROW] key combinations to move around the file and [DELETE] to erase mistakes. There's no insert mode.

The last column is reserved for a right margin. Text will wrap around as you type, which may cause words at the end of a line to appear broken. But after you SAVE

the screen, the word-wrap feature will re-justify your text properly.

When you're through typing, press [ESCAPE]. The editor will fill the screen with asterisks as it reads and stores your text.

Now either select [2] from the main menu to SAVE your text to disk for future reference, or go directly to the prompter by pressing [4]. If you want to SAVE your text, do so *before* using the prompter.

If you couldn't fit the whole speech into the screen editor, SAVE the text to disk, return to the screen editor and finish typing. Then SAVE the text to the same file. When the program offers the choice of either overwriting or appending to the end of the old file, select Append. Then LOAD the entire file and press [4] to begin scrolling.

PROGRAM TAKE-APART

The program has four main sections: the screen editor, the read/write subroutines, the string parser and the scroller. All sections use Graphics 0 except the scroller, which is in Graphics 2.

Lines 500-640 present the main menu. Lines 1000-1700 contain the prompter. The joystick value is constantly checked, both while sending text to the screen and while waiting for a trigger press. Memory location 764 contains the value of the last key pressed, so it is checked often to see if the user wants to quit.

Lines 1500-1700 determine the scrolling direction and highlight the top line for easier visibility.

Lines 2000-2130 OPEN and read a file, ignoring carriage returns and control characters which would make the display look confusing.

Lines 3000-3999 SAVE text typed into the editor, first making sure the file exists and, if so, whether the user wants to append or overwrite it.

Lines 5300-5630 contain the parser, which organizes the text so that words at the end of screen lines aren't broken apart. First, it determines how many words in T\$ (entered from the keyboard or file) will fit on a 20-column line. Then it puts those words into T2\$ and pads the rest of the line with spaces.

The screen editor, beginning at line 7000, is limited, but it lets you enter and edit up to 936 characters. The editor OPENS the keyboard for INPUT, then GETs characters until the [ESCAPE] key is pressed. It doesn't let you insert characters, type past the bottom of the screen, or use the last column which is reserved for a margin.

When [ESCAPE] is pressed, the editor finds the last non-space character on the screen. Then it goes to the beginning of screen memory and gets the text you have typed.

Lines 10000-10999 initialize the main variables used in the program.

Error trapping for I/O problems begins at line 20000. After the problem is analyzed, a message is displayed. Control is returned to the section of the program where the error occurred. ■

Listing on page 65

making the necessary corrections and fixes. Some minor formatting problems usually crop up and last-minute text changes are commonplace—"a way of life," says Franz. But the computer can make the changes instantly.

5. Q-TV sets up the equipment for the broadcast itself.

6. "Then it's go, go."

"We firmly believe in battery-backups—having learned about them the hard way," says Franz, "and we usually have a second system nearby in case of failure." This rarely happens, but it is possible for the equipment to be banged around in its cases during transit.

"The Atari is very resilient, but it doesn't endure coffee and Coca-Cola spills," Franz says. "It's also somewhat limited in memory size, but you can still put a two-hour speech in the 800XL."

Q-TV uses several Atari colors—if the speaker requests a color monitor. However, the words show up better in monochrome. They use 2,000-line monitors and, although the Atari can only handle 1,000 lines, the results are excellent. Q-TV also uses modems to transfer text files, but they only use 300 baud because they have found it to be more accurate than 1200 baud.

"There are several systems similar to ours," says Franz. "Computer prompting is the wave of the '80s."

Maverick Atari School

Idaho kids program Lego robots

By Gregg Pearlman, Antic Assistant Editor

Why are adults the only ones doing research and development? Kids can do it, given the chance," says Patrick McShane, 42, headmaster of the PCS School for Advanced Learning in Nampa, Idaho.

McShane, a former schoolteacher, gives those kids the chance at PCS—a "true R&D think tank." PCS originally stood for Patrick's Computer Service—an entirely different McShane venture—and students decided to adopt the name for their school.

PCS students range in age from first grade through 12th. Three years ago a nine-year-old student said "I want to run my Lego motorized stuff from the computer." That's how CAMLU (Computer Activated Motorized Lego Unit) got started as a course of study.

"I started teaching out of my home in 1984," says McShane. "Eventually, people whose kids couldn't get what they wanted from computers at school came to me. I had a reputation of knowing a *little* about computers, so I started taking on students, and then it grew and grew. Last summer I taught 15 students out of my home, and I decided, 'Whoa—it's time to expand to a public building.'"

Word of PCS gets around without help from advertising. "I've never had to advertise," McShane says. "I just keep adding students. I even had a student from France. We have 70 now, and several enroll just for the summer. No one's dropped out—well, one student had to move to Montana. Only 10 of the students are girls, but I try to recruit more."

There used to be an age minimum of nine, but a couple of people who really wanted to

enroll their children "didn't exactly tell the truth" about their children's ages. One boy turned out to be six. "He can handle even the 1040ST as well as the other kids," says McShane, "so I dropped the

age restriction."

CLASSES OF THREE

Each student has a time slot, but there's no actual class structure. "We start with a three-month 'introduction' series of classes," says McShane, "and then students pretty much choose their own direction. They start writing programs for controls, which is very involved, and they have to understand a little machine language."

Students attend PCS once a week for 90 minutes. There are never more than three at a time in class. "They're mostly average, mainstream kids," says McShane. "Sure, some are gifted, but others have learning disabilities. The difference between these kids and the kid down the street is the drive and desire to excel and explore."

"I used to balk at taking on kids with learning disabilities—dyslexia, autism and mild retardation, but now there are some in our program and they're doing very well. In fact, our CAMLU graphic was done by an autistic boy who drew it in 15 minutes with NEOchrome. Little is known about autism except that it's difficult to deal with and that communication is limited, but the computer has unlocked things for this boy. He has a better self-image and he's doing better in school."

The school owns about \$3,000 worth of

Lego pieces. Besides the supply for PCS students, McShane also needs some when he takes CAMLU to other schools once or twice a week. "Last fall we got a grant from the Whittenberger Foundation in Idaho, which has let us bring demonstrations of our teaching concept to the classrooms," says McShane.

Lego has provided sets that aren't publicly available—for example, PCS has a plotter made of Legos. The students have modified the original design "because it didn't work quite right," and now it's connected to an Atari.

"Lego was developed originally to teach mechanical engineering principles at the high school and university levels," McShane says. "They're true miniatures of things that work in the real world. I'm not trying to create little mechanical engineers, just to open up an understanding of it." John Crowley, director of the Technic division of Lego Systems, Inc., visited PCS in August, 1987.

"We have a hoist that travels on a rope and lifts 41 pounds—with a 4-volt motor—all made from Legos," says McShane. "The Lego people couldn't believe it. They thought it couldn't lift more than two pounds. It took 46 students three months and it all started when someone asked, 'What should I build today?' I said, 'Build something that climbs a chain.' It's an extremely complicated, very fine piece of machinery."

LOW TUITION

McShane charges \$25 per month per student. Some families have more than one student, but the most he charges any family is \$40 a month. "Maybe I'm selling myself short," he says, "but I'd rather see this technology available to anyone, not just upper-class families who can afford more. We're making money *now*—a year ago I'd have said no. All extra money goes back into the school for whatever we need."

Since the sole source of income is student fees, McShane isn't in a position to pay anyone. "So if something happened to me today," he says, "the technology would go right down the tubes. Only about 40% of what happens here has been documented."

PCS students come from 50 miles around. "I'll be expanding PCS to Boise, the state capital," says McShane, "which would be a good move financially. But I have an ethical obligation to my original students here, that's why I want to stay in Nampa. I'm doing this expansion jointly with Dr. Trudy Comba, head of Small World Center, which takes children up to first grade—naturally leading to PCS after-

goes over lesson plans with
youth instructor.

ward. I envision three PCS centers by next year.

"I think we could market some of what the kids develop here. However, I'm not a businessman. People say I should raise my prices, do this, market that—I'm not a money-raiser. It should be done—but by someone with those skills."

McShane runs the school with the help of a volunteer bookkeeper and 14-year-old youth instructor Tim Rhodes. "We don't teach, we guide," says McShane. "We help the kids set a direction. We provide enough information to get started, and their creativity takes over."

"Our bookkeeping is done on an 8-bit computer. The big database for our Lego inventory is done with SynFile+. I think it's important to know that you don't need an IBM for this kind of thing."

McShane typically works at PCS from 7 a.m. till 11 p.m., Monday through Saturday, and it's even more hectic in the summer. Does he ever get time off? "Not really," he says.

McShane and the students write their own texts. Available resource material wasn't geared high enough for their purposes. "Even the little kids were insulted by stuff written for junior high," says McShane.

All the kids learn word processing, database management and spreadsheets. McShane believes that those three pieces of software will be crucial in their lives. And they all work on CAMLU News, the PCS newsletter, on a rotating basis.

"The technology we've developed *should* be available to kids," says McShane. "It's important for them to be creative and use their imaginations. Let's face it, the schools don't have the resources, trained teachers or, especially, money. We can't find anything even remotely close to what we're doing here."

ATARI ROBOTS

Robotics is the main subject at PCS. "I say that if you can think it, you can do it," says McShane. "I wanted to show that a joystick isn't only for games, so the kids came up with a space shuttle where the robot arm is controlled by the joystick."

"We use the Logo programming language, which is fine for teaching elementary robotics command controls. There's also Atari BASIC, but it's too slow, so we use BASIC XE, Turbo BASIC XL and ACTION!. Sometimes we pop in the Microsoft II BASIC cartridge, which has features that others don't."

This year PCS is building optical and touch sensors for its robots. "Let's face it," McShane

Math Flashcards

Arithmetic drill that kids really use

By Andy Barton

Math Flashcards is a direct, no-nonsense arithmetic flashcard program that kids enjoy using. This BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.

There are many elementary-school arithmetic programs for the Atari. I have four or five myself, but my children won't use them. The kids have outgrown the count-the-dots programs, they're frightened off by the competitive programs, or they play with the flashing colors and dancing creatures and don't learn the math.

Arithmetic Flashcards is a simple, straightforward, non-competitive math program designed to help children learn the primary arithmetic tables for addition, subtraction, multiplication and division. It's interesting, but not flashy. A little randomized music routine rewards each

correct answer, a slightly longer routine plays after each set is successfully completed, and a long routine sounds after nine sets are finished.

The emphasis is on repetition. In

each set the child must get 15 consecutive problems correct before advancing. If the child gets an answer wrong, the screen turns red, the count is reset to 15 and the child must come up with the correct answer before continuing. The missed problem is repeated three times on an orange screen alternated with new problems.

Speed is important. If there is no answer given within 20 seconds a buzzer sounds and the error routine begins. Every 20 seconds the buzzer gets longer until a "Get Going" message prods the child on.

The program is aimed at learning, not at making mistakes. The number of correct answers and the total number tried are displayed. But the number of errors is not

directly monitored. I did make one concession to my kids. The program allows them to skip easy sets by choosing the set they wish to start with.

GETTING STARTED

Type in Listing 1, **FLASH.BAS**, check it with **TYPO II** and **SAVE** a copy before you **RUN** it.

If you have trouble typing in the special characters in line 10070, don't type them in. Listing 2 will create them for you. Type Listing 2, checking it with **TYPO II**, and **SAVE** a copy to disk or cassette. When **RUN**, Listing 2 will ask you whether you are using a disk drive or a cassette. Next, the program creates these hard-to-type lines, and stores them in an disk file called **D:LINES.LST** (for disk owners) or to a fresh cassette tape.

To merge the two programs, **LOAD** Listing 1, "**D:FLASH.BAS**" then **ENTER** "**D:LINES.LST**". (Cassette owners should **CLOAD** Listing 1, then insert the tape file created by Listing 2 and type **ENTER** "**C:**").

Finally, remember to **SAVE** the completed program before you **RUN** it.

CUSTOMIZING

To accommodate your individual needs and style, several variables were used to make it easy for the inexperienced programmer to customize Math Flashcards. Change the value of the following variables as you wish and **RUN** the program. When you are satisfied with your changes **SAVE** it back to disk.

In line 10240, **COUNT** determines the number of consecutive correct answers needed to go on to the next set. **SET** determines the number table that the program will start at. The option of choosing the starting set can be eliminated by deleting lines 10200 through 10220 and giving **SET** a value from one to nine.

In line 10250, **TLIM** sets the time limit for typing the answer. A value of one is extremely quick, about four seconds, and a value of five allows about 20 seconds. **REPEAT** sets the number of times a missed problem is repeated.

Line 10260—**CTUNE**, **STUNE**, and **ETUNE** are the number of notes played after a correct answer, after each set and after set nine. **BUZZ** is the length of time the buzzer sounds for a wrong answer. **BUZZ** is converted to **PAUSE** which is increased in line 70 to determine if, in line 80, the "Speed Up" message is printed. ■

*Andy Barton of San Carlos, California is the author of **TYPO II**, which has appeared in every issue of **Antic** since January, 1985.*

Listing on page 73

says, "a robot without sensors isn't a robot at all."

PCS has an old 800—"which I *won't* get rid of" — a modified 800XL, three 130XE systems and a 1040ST—"we drool over a hard drive for it." There's also a CompuServe account for the kids to do research. We've had no equipment turnover whatsoever. We had our ST since December, 1986, and if we lost it, we'd be in trouble—everybody uses it."

But how do these Atari computers control the robots?

"We use joystick port 1 on the 8-bit computers to access the Peripheral Interface Adapter (PIA) chip and we configured memory location 54016 as output," says McShane. "Once we found the right combination of bits for using that address, the students split it into two nibbles. The low nibble is used for output and we can still access the other nibble for input devices. (See Stepper Motor Robot Controller in *Antic*, December 1986, pages 62-65.—ANTIC ED) So the kids' Logo programs can use not only the keyboard to control robotics, but also the joystick in port 2. The programs can also send information to the interface in port 1 and a Covox Voice Master."

The students developed the technology, with help from a Hewlett Packard technician who teaches electronics twice a month. "*Antic* Magazine is our resource material," says McShane. "Lots of good support. If the place caught fire, *Antic* would be the first thing out the door."

CUSTOM COVOX

"When the kids wanted to use voice control, I bought a Voice Master from Kevin Gevatosky at Covox" McShane recalls. "Location 54016 was locked up—and that's the address we absolutely must have. Kevin never dreamed we'd use his product this way, but he rewrote the code for us. We probably have the only Covox version that permits output on port 1 to control our vehicles. The implication here is that the controls can be used for anything. So quadriplegics using Voice Master, as long as there's nothing wrong with their speech patterns, should be able to control anything."

"The interface we've built for our motor control unit (MCU) costs only about \$5 in parts—I'd really like to make that available. We've written tons of programs for the controls, and so many people have Lego sets at home. There's a wide market for it."

PCS has had its MCUs for two years. They've

continued on next page

Name the Presidents

"Woodrow who. . ?"

By Peter Loeser

This simple, short program helps youngsters learn the Presidents of the U.S. It works on 8-bit Atari computers of any memory size, disk or cassette.

Name the Presidents requires you to identify all 40 American presidents in the order they were elected. It gives you both the number and first name of each president and then asks for the last name.

If you guess correctly, you keep going. If you're wrong or don't know the answer, you can either continue guessing or type HELP for the correct answer. When you've named all the presidents, the number of your guesses is displayed.

START NAMING

To play Name the Presidents, type in Listing 1, PRESQUIZ.BAS, check it with TYPO II and SAVE a copy before you RUN it. The answers have been encoded, to discourage students from peeking.

To change the number of presidents after the 1988 election, change the value of the variable TL in line 115. Next, encode the entry by substituting each letter of the president's last name with the next higher letter of the alphabet (FORD, for example, would become GPSE). Finally, add a new data line after 920 and remember to include the final line: DATA 0,END,END.

As a high school social science teacher and president of The Educator's Atari Club (TEAC) in Laytonville, CA, I have produced and rewritten educational programs for our users group's library for several years. I wrote this program for

Antic as a thanks for all the educational programs they've published in the past. Our group now has a library of over 25 classroom-tested educational disks, and because Atari educational software is so hard to come by, we do all we can to find or produce new public domain programs. ■

Peter Loeser invites teachers to find out more about what The Educator's Atari Club is up to. Contact TEAC at P.O. Box 1024, Laytonville, CA 95454.

Listing on page 67

been banged around and subjected to cold, heat and rain. "They haven't failed," says McShane. "You can't hurt them—they never need any repairs."

While McShane hasn't needed to advertise, he and PCS have had local television and press coverage. "The media people ask the wrong questions, though, and are *very* patronizing," he says. "But we've considered approaching public television at Boise State University about a series on micro-robotics.

"But when you say Nampa, Idaho, people don't know where it is, and they figure that nothing exciting develops here. And they think Lego's a toy—they're unaware of its educational value."

The students have been in contact with some of the movers and shakers in the Atari community—as well as the computer field as a whole. PCS students have written to retired Rear Admiral Grace M. Hopper, the inventor of COBOL, Steven Witzel, president of Multi-botics, Inc. in Woodcross, Utah, and Tom Hudson. "The kids must understand that they *can* approach the movers and shakers," says McShane. "Just because they're important in their field doesn't mean they're unapproachable. The very worst that could happen is not getting a reply."

McShane impresses upon his students that their main responsibility is to their families and themselves, then their schoolwork and finally PCS or other extracurricular activities. "If students get a D or F in *any* school subject, they are suspended from PCS," says McShane. "Those grades are important. State law demands a C average to graduate. But with one or two exceptions, the kids are all A or B students.

"Most of them participate in sports. That's important. If you're not physically fit and sit in front of a CRT all day long, you'll become a computer nerd."

McShane says that adults often are intimidated by PCS—it's over their heads, etc. "I say they don't need to understand it—just to *appreciate* the creativity. I mean, some of it's over *my* head. But if they really didn't like what we did, they'd pull their kids out of class."

The three simple school rules are "be respectful, be realistic and be reliable." "It's important to keep things in proper focus," says McShane. "For example, it's unrealistic to try building something out of Legos that could fly—Legos aren't aerodynamic. However, I'll give \$1,000 to any student who can do it—short of throwing the Legos against a wall." ■

Checkbook Balancer

End bounced checks the easy way

By Rod Saylor

This compact but powerful listing produces a user-friendly calculating database that will keep your checking accounts current. Check Balancer is a BASIC program that works on all 8-bit Atari computers with at least 24K memory and a disk drive.

When I bought an Atari 130XE computer my wife wanted to know, "Can you balance the checkbook with that thing." I replied, "Well, you can, but. . ." And she said, "Just as I thought—another toy."

I couldn't let her get away with that, so I looked through countless magazines and books until I found a type-in checkbook program. It was

huge and took me about six hours of typing.

I proudly announced, "Here it is, honey." But as I demonstrated it for her, we found that the program required a degree in accounting to understand. So I gave up and bought a commercial home-finance program that kept track of everything, from what day I bought a pack of gum to

continued on next page

how much money I spent on batteries last year. Yes, this impressive program would do it all—if I remembered to type in a stack of receipts and notes every day, and didn't mind swapping disks four or five times per session.

There had to be a better way. This straightforward, no-frills Checkbook Balancer program was born of a frustrated desire to make my wife believe in my Atari computer.

USING CHECKBOOK BALANCER

Just enter your deposits, checks and electronic teller transactions as they occur, comparing your records with what you type into the computer. When you get a bank statement, delete the checks that have come back. Enter any interest as a deposit, enter any service charge as a *negative* deposit such as -3.45. Then select choice 6 to compute your new balance, and compare the number in the upper right corner of the screen with the total in your bank statement. That's all there is to it.

Start regaining control over your checking accounts today. Type in Listing 1, BALANCE.BAS, check it with TYPO II and SAVE a copy before you RUN it.

Press any key to make the working screen appear. The program then loads your check information from a disk file called CHECK.DAT and displays the first check from the new balance period. If you don't have a CHECK.DAT file on your program disk, the program will prompt you to create a new one or load one from a different disk.

You can enter checks or electronic teller transactions in any order. However, it's easier to delete returned checks if they're in numerical order.

The menu commands can be either numbers or letters. This gives you the option of using the Atari CX85 numeric keypad. Just load the CX85's handler program before using Checkbook Balancer and you're ready to go. Whenever Checkbook Balancer prompts you to verify a command, you can press either [+] or [Y] on your computer. (The computer's [+]

ENT	CHECK #	AMOUNT	C/R BAL	ACCOUNT

1-Enter 2-Delete 3-Change data?

key corresponds to the [YES] key on the CX85.)

MAIN MENU

Press [RETURN] to switch between the two menu lines at the bottom of the screen.

E or 1—Entry Number. Type the next unused entry number from the E# column. Then follow the prompts. You will be asked for a check number and an amount of money. If all entry numbers are filled up through E# 99, go back to E# 1 and start over. If Checkbook Balancer won't take your E#, there's something wrong with that block of entries. For electronic teller transactions, enter the *day.month* of the transaction (such as 23.05) when you are prompted for the check number.

D or 2—Delete an entry. Select the entry with the cursor control keys—or with the joystick. Press [RETURN] or the joystick button to delete it. Press the [ESCAPE] or move the joystick sideways to abort this function.

C or 3—Change data. Displays the block of data you're interested in or lets you make deposits. Type the E# (entry number) of the record you want to display, or type [0] to enter a deposit.

SECONDARY MENU

As stated above, press [RETURN] to switch between the two menu lines at the bottom of the screen.

S or 4—Save data. Follow the prompts to save your data to the CHECK.DAT file.

R or 5—Retrieve data. This option loads a CHECK.DAT file and displays

the first check from the new balance period. If you don't have a CHECK.DAT file on your disk, the program will prompt you to create a new one or load one from another disk.

S or 6—New balance. This option recalculates your account's end balance.

P or 7—Prints a list of outstanding checks.

Q—Quit. This choice does not appear on the menu. Type [Q] to end the program. Be sure to save your data before leaving the program.

PROGRAM TAKE-APART

10-40	Startup screen.
50	Sets up strings, makes the cursor and inverse video invisible.
60-120	Sets up working screen.
160-240	Main selection menu.
250-255	CLS subroutine—clears message window, repositions cursor for next message and disables the [BREAK] key.
260-350	Secondary menu.
360-410	Entry subroutine.
450	FIG subroutine, math for balance.
460-520	Delete check subroutine.
530-540	Deposit routine.
550-590	PRT subroutine, clears screen and prints new data.
600-680	Disk storage routine.
690-780	Disk retrieval routine.
790-810	Math for account end balance.
820-890	Routine to print outstanding checks.
910-960	Subroutine for joystick deletion.
1000-1100	Disk error handler.
1110-1200	Creates a blank CHECK.DAT file. ■

Rod Saylor is stationed in Europe with the U.S. armed forces. He is a member of the Eifel Atari Users Group, which is named for the mountains on the France-Germany-Luxemburg border, not the tower.

Release the POWER of your mouse

TextPro

Write a novel...

TextPro—This is a serious word processor! Written with speed and maximum control in mind. Advanced features—mail merge for form letters..., multiple columns, automatic table of contents, automatic index, sorting (to alphabetize list of words) and define up to 30 user definable keys. Full screen editing with mouse or keyboard. **\$49.95**

PaintPro

Create a masterpiece...

PaintPro—Draw upon your creative talents with **PaintPro**, the GEM-based, full-page graphics design package. Multiple windows. Cut & paste. 16 tools. Variable line width. Define your own fill and line patterns (up to 32 in memory at once). **\$49.95**
PaintPro Library #1—Many clip-art pictures, 5 GDOS fonts. Degas compatible. **\$29.95**

DataRetrieve

Manage a mailing list...

DataRetrieve—Data management was never this easy! Design your database using the mouse. *Lightning-fast* operation; tailorable display; user-definable reports; up to 64,000 records. Supports multiple files. Includes RAM-disks. Complete search, sort and file subsetting. Works with TextPro. Easy printer control. Five setups included. **\$49.95**

PowerLedger

Plan a budget...

PowerLedger—Finally, a full-powered spreadsheet for your ST. Powerful, large capacity (65,000 by 65,000 cells) spreadsheet. Built-in calculator, online notepad and integrated graphics. Seven different chart types (pie, bar, 3D bar, line, etc.) Multiple windows (up to seven). 14 digit precision with 37 math functions. **New Version! \$79.95**

Antic Prompter ST

By Patrick Bass, ST Resource Technical Editor

Giving Yourself That Cronkite Confidence

Robert Kopecky

They make it look so easy.

Every night, your local newscasters stare deeply into the TV camera and tell you what happened that day, without once looking at the notes they hold. How do they do it? Do they memorize all their stories before the show? Of course not. The text of what they have to say is displayed in big letters on a screen next to the TV camera, and the newscaster reads his

or her story right off this screen.

The device that performs this work is called a prompter. Elsewhere in this issue of Antic you'll find Gregg Pearlman's article detailing the Video Prompter produced by Q-TV Prompting Systems, and Heidi Brumbaugh's program and article showing how to get a video prompting program running on the Atari 8-bit computers.

This month The ST Resource presents Antic Prompter ST, the ST version of Heidi's 8-bit Antic Prompter. It's written in GFA BASIC, runs on any color or monochrome Atari ST system, and will smoothly scroll ST text files (using very large letters) up the TV screen at speeds ranging from very slow to faster than most people can talk.

USING ANTIC PROMPTER ST

There are two ways to get a copy of Antic Prompter ST up and running in your Atari ST. First, you may type in *Listing 1*, STPROMPT.BAS, using GFA BASIC. Second, those of you who get the Antic Disk edition may copy the program STPROMPT.PRG from side B of the 5.25 inch Antic Monthly disk to your own 3.5 inch ST disk using LinkLine. The instructions for using LinkLine to copy files are contained inside the HELP file on side B.

If you choose GFA BASIC to enter *Listing 1*, type the program in carefully and save a copy to disk before you run it. While we don't have a TYPO program for GFA BASIC yet, GFA BASIC will check the syntax on each line you type in automatically. However, be careful with variable names and constant values, as these cannot be checked for accuracy by GFA BASIC.

PROMPTING A FILE

When you run Antic Prompter ST, the screen will clear and then present a typical File Selector box for you to select the text file to show. Either type in or click on a filename to select it. If the file is present on the disk, the

AtariPrompter ST will scroll a text file using large letters across your television screen.

screen will clear again, and the file text will begin to scroll slowly up the screen in large letters.

You may control the speed of the scroll with the numeric keys on the ST keyboard. The keys 0 through 9 control how slowly or quickly the text scrolls up, with [0] being the fastest and [9] being the slowest. When your file has finished scrolling past, a small alert box will pop up and ask if you wish to display another file. If you don't, click on the exit button. While Antic Prompter ST is displaying a file, you may stop it by holding down either mouse button for about a second.

PROGRAM BREAKDOWN

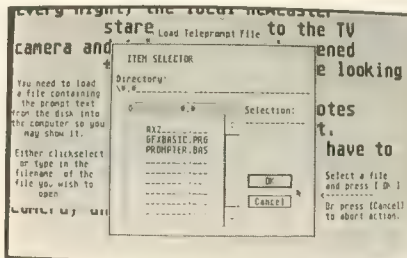

Examine *Listing 1*. This is the source code to Antic Prompter ST written with GFA BASIC. Let's go over the code here section by section and discover what it does.

Initialize

This part of the source code gives us a place to assign initial values to variables and create space to save program information. Notice that this section is where the program will make decisions depending on what resolution you power up in. For example, if you power up in low resolution, the program will ask you to switch to medium resolution and then drop back to the Desktop.

Keep in mind the resolution differences between medium and high. Both are 640 dots wide, but the high-res screen has twice as many dots vertically (400) as opposed to 200 for medium-res. There is a system call to

return the current screen resolution, called **XBIOS(4)**. This call returns a zero for low-res, a one for medium resolution and a two for high-res. To write this program so it can operate in medium- or high-res, I first assume medium-res and then multiply any reference to the vertical scale by multiplying it by the number returned by the **XBIOS(4)** call.

Open_text_file

This procedure will present the File Selector box for you to enter the filename of the file you wish to show on Antic Prompter ST. It also presents a few boxes of helpful information on the use of the File Selector, allows you to choose the file and then exits.

Read_the_file

Now we get to the main section of the code. If the file you ask for really does exist, the program will clear the screen, open the disk file you asked for, and determine the length of the disk file. Next, it will write the name of the file you asked for onto the

screen as a reminder to you of which file was actually opened.

Now we fall into the main REPEAT loop. First, check to see if a keystroke has been pressed. If one has, check to see if it was a numeric key between one and nine. If it was indeed a numeric key, use the value of the key (times ten) as the delay value between lines displayed onscreen.

Otherwise erase the string we'll use for the next line to be displayed. Next, actually go to the disk and get the next line of characters (up to the next carriage return) and place it into **Raw_input_line\$**. Then actually place the line onscreen with the **Format_new_line** call, and subtract the length of this line from the total size of the text file the program is currently displaying. Continue the REPEAT loop until we have displayed the entire file.

Scroll_the_screen_up

To actually smooth-scroll the ST screen, we use the Block Move command in GFA BASIC to grab screen memory running from one line from the top of the screen down to the bottom, and move it one line up. Everything else on the screen moves along with it, producing the scroll up.

PRACTICALLY PRACTICAL

Y'know, I just remembered that last month I wrote another practical program for the Atari ST ("Pursuit Of The Graf STrivial"). If I don't watch out, people may start thinking an Atari computer is good for more than just games, eh? ■

ST DIGITIZERS

ST VIDEO DIGITIZER

Digitize from any standard composite video source (e.g. VCR, video camera, etc.) Save digitized pictures into NEO, or DEGAS file formats.. This is the fastest digitizer available for the ST.

Capture single frames in less than a second. Excellent for student, hobbyist, or to put pictures in your desktop publishing projects. The picture above was taken with the ST Video Digitizer and printed directly on a laser printer. If you were thinking about getting a video digitizer then this is the deal you've been waiting for.

\$59⁹⁵

Regular price: \$139.95

ST SOUND DIGITIZER

Digitize real-world sounds from microphones, record player, tape recorders, guitar etc., then play back with your MIDI keyboard. The ST Sound Digitizer can be used to create music, experiment with sounds, edit short commercials, or use for voice mail. Very easy to use software provided powerful editing and mixing features. This product is normally sold for \$139.95. Get in on this deal and save \$60. dollars. but hurry, only a limited supply is available.

\$79⁹⁵

Regular price: \$139.95

TIMEKEEPER

This is our popular clock calendar plug-in cartridge. The TimeKeeper comes complete with removable long life lithium battery ready to use. Just plug it into the cartridge slot and set up either an Auto folder or Accessory program to automatically set Time and Date each time you turn on your ST.

\$19⁹⁵

Regular price: \$49.95

BALANCE OF POWER

Mindscape

3444 Dundee Rd.

Northbrook, IL 60062

(312) 480-7667

\$44.95

Reviewed by Harvey Bernstein

The sweat broke out on my forehead as I anxiously awaited the Soviet response. Having increased military aid to the Indonesian government to four billion dollars in order to prevent a Communist takeover, I've withstood several challenges to my action from the U.S.S.R. Now, however, I've gone to DefCon 3 and placed our forces on a world-wide alert. If the Russians don't back down now, there is an excellent chance nuclear war will follow, surely meaning an end to the game (not to mention the world!). Fortunately, they "blink," and take their protest to the United Nations. I guess they didn't want to go to war over Indonesia any more than I, but my increase in prestige worldwide gives me a good lead in the game.

The above scenario is but a mere shadow of what playing **Balance of Power** is like. If there was ever a game designed for the new generation of 16-bit home computers, this is the one. No, there is no animation or fancy graphics. In fact, author Chris Crawford has gone out of his way to

avoid a magnificent animated end-of-the-world display. Balance of Power, however, is one of the finest examples of artificial intelligence implemented in a computer game to date, and the most challenging and nerve-racking keyboard encounter I've had, *including* all my years as a text-adventure player.

The game is not easy to summarize in a short review, but I'll try. You take the role of President of the United States (or Premier of the U.S.S.R.) for an eight-year span. As leader of your country, it is your responsibility to gain greater worldwide prestige and acclaim than your adversary. By using the resources at your command, including military and economic aid, troop placements, diplomatic pressure, and even the CIA (or KGB), you do everything in your power to support friendly governments, topple unfriendly ones, and perhaps persuade those on the fence to see things your way. Of course, your opponent will be doing the same.

The real challenge of the game comes in two areas. First of all, your realization that every action determines how the rest of the world looks at you, whether or not that action directly affects them. For instance, you may have a conventional defense treaty with an ally, such as Indonesia in the example above. By allowing that government to fall, every *single one of your allies* will reconsider

their relationship with you and start looking much more favorably upon your opponent, resulting in a considerable loss of prestige (and appropriate gain by the other side).

The most challenging aspect of Balance of Power, however, and the real arena in which the game is won and lost is that of crisis management. Either side can challenge an action of the other on the battlefield of international diplomacy. If the challenged party feels strongly enough about what he is doing, he can reject the challenge. The action can be re-challenged, refused again, each level raising the stakes (prestige value) higher. Starting with a backchannel discussion (considered to be a quiet chat behind closed doors), and commencing through a diplomatic crises, and several levels of military crises, a challenge can result in the winning or losing of the game, depending on who loses his nerve. The twist is that the more often you head recklessly into a military crises, the more likely it is that the next one will end in an accidental nuclear war, bringing the game to an end and causing both sides to lose.

Thus, you cannot do whatever you want (sending 20,000 troops into Cuba, for instance) without invoking the wrath of your opponent. You must make every move with the consideration of whether or not you will

continued on next page

be challenged, and how far you are willing to go. Conversely, you need to carefully scrutinize your opponent's moves, determining which parts of the world he feels strongly enough to go to the mat over, and in which he is simply flexing his muscle. The one game I completed and won required keeping copious notes on how my opponent reacted to my most important actions.

One of the greatest aspects of computer games is that they allow you to live dangerous or thrilling adventures vicariously. As I mentioned earlier, the graphics in *Balance of Power* are nothing to write home about, but if you want to lead the life of a Machiavellian power-hungry megalomaniac, then this is the game for you.

FIRST SHAPES KID TALK MATH TALK SPELLER BEE

First Byte
distributed by Electronic Arts
1820 Gateway Drive
San Mateo, CA 94404
(415) 571-7171
\$49.95 each

Reviewed by Sol Guber

First Byte has brought out a set of educational programs for the Atari ST—**First Shapes**, **Kid Talk**, **Math Talk** and **Speller Bee**. Each of the programs can talk to you using a built-in software speech synthesizer. The speaking aspect is used to help teach young children about shapes, math and spelling. The programs are effective teaching tools, but some of them utilize the speech synthesizer more effectively than others.

There is a great deal of similarity in these four programs. When the programs start, they all say the name of the program and the company, First Byte. They also all use a specific char-

acter to do the talking. *First Shapes* has Ted E. Bear, *Kid Talk* has a parrot, *Speller Bee* has the Bee, and *First Math* uses Professor Matt A. Matics. You can understand all of the characters, but the most intelligible is Ted E. Bear, since he says the fewest number of

different words. The speech synthesizer helps make the learning experience more enjoyable and probably increases the time a child will spend at these games. The games also allow you to customize them for an individual child. You can add complements and praise as well as a child's name into a file, which you can then add to future games.

All of the programs are structured in a similar manner. They use only medium resolution, which limits your colors to four, but this is not particularly offensive. The programs use menus with their on-screen pictures, activated by the mouse controls for choosing the various options in each program. The mouse control makes the programs easier for young children to use. Also, each program has many sections to it, so that they will hold a child's interest longer. The sections are divided into parts for learning and parts where you play games, and the education aspects are not so obvious.

My nine-year-old daughter's favorite game is *First Shapes*, even though this is for younger children. It "Introduces Young Children to Geometric Shapes" and teaches you about ovals, circles, squares, triangles, and big and little. There are many sections

to this program. In the first, Ted E. Bear shows you the shape and says the word. Once you can recognize the shapes, you get to play three little games with Ted. You can play any of the games by picking them from the menu, which also has pictures for

each of the games.

Math Talk is my daughter's second favorite program. As it states, it's "a powerful learning tool for mathematics mastery" and gives you drills in addition, subtraction, multiplication and division. This program is for older children. It is very effective and nonjudgmental when you make a mistake. If you make a mistake more than once, the professor will come and remind you how to do the problem. It also allows children to do their own problems by setting up a math book, then quizzes them until they can solve them correctly.

Besides the simple drills, there are also two games in this program, *Table Talk* and *Mystery Number*. *Table Talk* lets children fill out the math tables by giving them many problems. It asks the child to guess out how long it will take him or her to finish the 100 problems. If the child thinks that the 100 problems are too many, he or she can quit in the middle and the program will issue a score. Since this is a timed test, it helps a child calculate faster. *Mystery Number* shows an equation with one of the numbers missing. The child has to determine the number. You can make the game easy or difficult. This is another method of learning the various arith-

ST Product Reviews

metic operations.

Kid Talk is a word processor program that says the letters, words or sentences as you type them in. This is a real word processor for children since it has many of the commands that a full-blown word processor has.

It allows for printing, deleting, and for movement of blocks of words as well as loading and saving data. It is very easy to learn all the operations. The program is somewhat slow (you can out-type it), but for a child who is not a touch-typist, this will not be noticeable.

Speller Bee is the last, and unfortunately, least-effective program. As the title suggests, it teaches you how to spell. It is often difficult to really understand the words in this one. To help you, the word list it uses is first shown on the screen and then it pronounces the words. Speller Bee comes with word lists of various difficulties, and you can also put your own spelling words into the game for drills.

There are three additional games with this program to help teach spelling. The first game is a "scramble" one—a word is shown on the screen, letters rearranged, and you have to guess it and type the correct spelling. The program will give you clues, like showing the word list or saying the word. There is also a detective game where the word is shown with letters missing and you have to guess it. There is also a word search game that puts the spelling words in the square. This is the best way for learning spell-

ing, since you just look at the words so long that you have to learn them!

There are many good points to all of these programs. There are tours in the program for both parents and children, and the mouse controls make the programs easy to use. All

you have to do is push a button on the screen with the mouse to perform actions. First Shapes is extremely effective for young children. It contains

many cute touches and allows the most customization of the programs. You can also save information on the disk so the program will remember information about each child. Each program comes with a 15-25 page manual that explains the programs well, and gives more information about the customizing features. There is also a section on the educational considerations of each program.

All of these programs are easy to recommend both for using the ST effectively, and the educational considerations. The spelling bee program is the poorest due to the fact that slight mispronunciations cause a word to be difficult to discern, but the other three programs are effective and fun for children to use. Unfortunately the programs are strongly copy-protected, making them difficult to run off a hard disk. ■

COPY II[®] ST

BACKUP PROTECTED SOFTWARE FAST.

From the team who brought you COPY II for the Apple, the Macintosh and the IBM comes a revolutionary new copy program for the Atari 520 and 1040 ST computers.

COPY II ST copies many protected programs automatically.

- Supports single and double sided drives.
- Includes a sector-based copier for fast, reliable copies of unprotected disks.
- Includes a bit copy mode for protected disks.

Requires an Atari 520 or 1040 ST computer with one or two drives.

Call 503/244-5782, M-F, 8-5 (West Coast time) with your  in hand. Or send a check for \$39.95 U.S. plus \$3 s/h, \$8 overseas.

Dr. T's MUSIC SOFTWARE

HAVE YOU SEEN THE Dr. LATELY

The Dr. . . . developing amazing new software for the ST!

KEYBOARD CONTROLLED SEQUENCER ST

The ST-KCS contains **THREE** modes of operation:

TRACK MODE is an automated 48-track tape recorder using the mouse to select ALL major functions. It features a "continuous overdub" function allowing patterns to be built up layer-by-layer in **REAL TIME** with **NO STOPPING!** Tracks can be **MUTED**, **UNMUTED**, or **SOLOED**; tempo changed; recording of **CONTROLLERS** or **AFTER-TOUCH** toggled on or off; **PUNCH** points **SET** and **PUNCH-IN** and **PUNCH-OUTS** recorded; and output **ECHOED** to any MIDI channel.

SONG MODE provides 126 sequences which may be recorded on, edited, independently looped, and chained together in **ANY** manner desired.

OTHER FEATURES include **FULL** editing of ANY MIDI event or parameter; transposition of velocity, duration, and pitch; auto-correct; inversion, retrograde; extremely flexible **CUT** and **PASTE**; and many more edit options. **SMPT** is supported through MIDI Song Pointer. A velocity-scaling feature allows easy creation of crescendos and decrescendos. Tracks can be split by synth key-position. **STEP-TIME** entry functions allow you to painlessly enter parts that you might be unable to play yourself.

FOR YOUR PROTECTION, WE CHECK ALL CREDIT CARD ORDERS FOR FRAUD

CIRCLE 031 ON READER SERVICE CARD

EASY-DRAW TOOLS AND LABELMASTER ELITE

The **Supercharger** (\$49.95) loads DEGAS and NEOchrome bit-images and lets you take advantage of all the bit-image clip art available. This package also loads scanned images or portions of any screen display as well as incorporating resolution-independent image files, displaying scanned images on color or monochrome screens and printing final images at a much higher resolution.

Font Pack I (\$39.95) comes in 9- and 24-pin version and contains Rocky and HiTech fonts. **Personal Draw Art** (\$29.95) has over 100 object-oriented images such as vehicles, borders and symbols. **Technical Draw Art** (\$29.95) is for Easy-Draw users creating technical illustrations, floor plans, etc. Drivers are now available for the Hewlett Packard Laserjet Plus and Series II printers and 24 pin printers (Star NB series, NEC P series and Epson LQ series). Each retails for \$19.95.

With the 100 designs on the **LabelMaster Elite** (\$44.95) disk, you can print labels with or without designs and in several formats, including mailing labels, 3×5 or 4×6 index cards, and 3.5-inch disk labels. You can import designs from Printmaster or use the graphics editor to create your own custom designs. Improvements over the original LabelMaster include enhancements such as circle, line, box, mirror-drawing commands and a clip board that lets you cut and paste between designs.

Migraph, 720 South 333rd Street, Suite 201, Federal Way, WA 98003. (206) 838-4677. PRESS.

DIVE. . . DIVE. . .

Command any of six classes of World War II submarines in either the Atlantic or Pacific, complete your mission, survive and return home. In **Sub Battle Simulator**, the 24 American and 36 German missions, based on historical data, include Seek and Destroy, Rendezvous, Lifeguarding and Patrol. Action takes place between 1939 and 1945 in one of three modes: Target Practice, Single Mission or Wartime.

\$39.95. Epyx, 600 Galveston Drive, P.O. Box 8020, Redwood City, CA 94043. (415) 366-0606. PRESS.

ALL 14 FINGER JOINTS

ARTablets, EI/O's new graphics tablets are actually electronic drawing boards used with an electronic stylus—so you can draw in the normal manner instead of trying to etch fine images with your mouse. However, you can still use the mouse and keyboard. The three ARTablet sizes (in inches) are 6×9 (\$395), 12×12 (\$539) and 12×18 (\$877). The two larger tablets come with a four-button "puck" for precision tracing and drafting. ARTablets are compatible with NEOchrome, the DEGAS programs, Publishing Partner, CAD-3D, First CADD, Aegis Animator and others.

EI/O Products, 1559 Rockville Pike, Rockville, MD 20852. (301) 869-5984. FINAL.

REPLACEMENT RIBBON

The **Brother M1409** ribbon from Aspen Ribbons (\$5.50 to \$10.50) work on Centronics (and Printstation) 210 and ITT 9317 printers, as well as the Brother M1409. The **Brother M1509/M1709** ribbons (\$6.25 to \$10.95) work with Ampak Business Systems 1509, Centronics (and Printstation) 220 and ITT 9318 and 9319 printers.

Aspen Ribbons Inc., 555 Aspen Ridge Drive, Lafayette, CO 80026. (303) 666-5750. PRESS.

THREE WISHES

The **New Aladdin** is a different kind of general interest publication—it's on disk. Six times a year you'll receive two disks containing an interactive magazine to be read, played with and manipulated. Conduct your own press conference with the president—he'll respond just as you'd expect—or read movie reviews and short stories, or even play games.

\$19.95 each, \$79.95 for six issues. Disk Publications, 12200 Park Central Drive, Suite 310, Dallas, TX 75251. (800) 346-6467. In Texas, call collect: (214) 788-4441. FINAL.

SOFTWERX MAXPAK FOR 50 BUX

This accessory and utility package for the ST includes a high-speed print spooler, a RAMdisk with auto-copy, a printer enhancer, a screen saver, keyboard macros, a digital screen clock, alarms, a file lister, an expression calculator and more.

\$49.95. SoftWerx, P.O. Box 71118, Murray, UT 84107. (801) 272-5623. PRESS.

POWER EDITING

P-edit, a full-screen line-oriented editor optimized for source code editing, features multiple large file-editing, inverse video, cut-and-paste and copy functions, online help and controlled global search-and-replace. Other functions include match/check nested parentheses, optional auto-indent, GOTO line number command, unlimited line length, horizontal scrolling and block shifting.

\$30. KEPKO (Kenworthy Engineered Products Company), P.O. Box 58338, Renton, WA 98058. (206) 271-4056. PRESS.

HI-TECH SALES

The **Sales-Pro Software System** (\$299), a point-of-sale and inventory control program, allows up to two billion records and handles end-of-day summaries, deposits and password securities. Add Module #1 (\$149) for customer files and backup capabilities, and Module #2 (\$149) for accounts receivables and lay-away capability.

\$499 if purchased as a package. Hi-Tech Advisers, P.O. Box 7524, Winter Haven, FL 33883-7524. (813) 294-1885. PRESS.

YOU CAN'T HIDE YOUR PRYING EYES

Encrypt—and later decrypt—any file: even a Captain Marvel decoder ring won't help the excessively curious. Whether your file contains corporate secrets or a potato pancake recipe, you still have every right to keep it private. The Double Agent cipherbase scrambles BASIC programs, spreadsheet templates, letters, business plans, research data—you name it.

\$29.95. Middle Coast Publishing, P.O. Box 2522, Iowa City, IA 52244. (319) 335-4078. PRESS. ■

New ST product notices are compiled from information provided by the products' manufacturers. Antic assumes no responsibility for the accuracy of these notices or the performance of the product. Each mention is followed by a code word indicating that, at press time, Antic had seen a FINAL marketable version, near-final BETA, earlier ALPHA, incomplete DEMO, or PRESS release.

Since 1981

Lyco Computer Marketing & Consultants

Lyco Means Total Service.

Mark "Mac" Bowser, Sales Manager

I would personally like to thank all of our past customers for helping to make Lyco Computer one of the largest mail order companies and a leader in the industry. Also, I would like to extend my personal invitation to all computer enthusiasts who have not experienced the services that we provide. Please call our trained sales staff at our toll-free number to inquire about our diverse product line and weekly specials.

First and foremost our philosophy is to keep abreast of the changing market so that we can provide you with not only factory-fresh merchandise but also the newest models offered by the manufacturers at the absolute best possible prices. We offer the widest selection of computer hardware, software and accessories.

Feel free to call Lyco if you want to know more about a particular item. I can't stress enough that our toll-free number is not just for orders. Many companies have a toll-free number for ordering, but if you just want to ask a question about a product, you have to make a toll call. Not at Lyco. Our trained sales staff is knowledgeable about all the products we stock and is happy to answer any questions you may have. We will do our best to make sure that the product you select will fit your application. We also have Saturday hours — one more reason to call us for all your computer needs.

Once you've placed your order with Lyco, we don't forget about you. Our friendly, professional customer service representatives will find answers to your questions about the status of an order, warranties, product availability, or prices.

Lyco Computer stocks a multimillion dollar inventory of factory-fresh merchandise. Chances are we have exactly what you want right in our warehouse. And that means you'll get it fast. In fact, orders are normally shipped within 24 hours. Shipping on prepaid cash orders is free in the U.S., and there is no deposit required on C.O.D. orders. Air freight or UPS Blue/Red Label shipping is available, too. And all products carry the full manufacturers' warranties.

I can't see why anyone would shop anywhere else. Selection from our huge in-stock inventory, best price, service that can't be beat—we've got it all here at Lyco Computer.

TO ORDER, CALL TOLL-FREE: 1-800-233-8760
In PA: 1-717-494-1030

Hours: 9AM to 8PM, Mon. - Thurs.
9AM to 6PM, Friday — 10AM to 6PM, Saturday

For Customer Service, call 1-717-494-1670,
9AM to 5PM, Mon. - Fri.

Or write: Lyco Computer, Inc.

P.O. Box 5088, Jersey Shore, PA 17740

Risk-Free Policy: • full manufacturers' warranties • no sales tax outside PA
• prices show 4% cash discount; add 4% for credit cards • APO, FPO,
international: add \$5 plus 3% for priority • 4-week clearance on personal checks
• we check for credit card theft • compatibility not guaranteed • return
authorization required • price availability subject to change

PRICE GUARANTEE

Since 1981, we have led the industry by continuing to offer the lowest national prices while providing quality service. Many companies have come and gone trying to imitate our quality and service. If by some oversight we do not have the lowest prices advertised on the products you desire, then we would appreciate the opportunity to rectify this oversight.

P.O. BOX 111327—DEPT. AT—BLAWNOX, PA 15238

*Please Read The Following Ordering Terms & Conditions Carefully Before Placing Your Order: Orders with cashiers check or money order shipped immediately on in stock items. Personal & Company checks, allow 3 weeks clearance. No C.O.D.'s! Shipping: Continental U.S.A.—Orders under \$100 add \$3; free shipping on orders over \$100. AK, HI, FPO, APO—add \$5 on all orders. Canada & Puerto Rico—add \$10 on all orders. Sorry, no other International orders accepted! PA residents add 6% sales tax on the total amount of order including shipping charges! REASONS FOR CALLING CUSTOMER SERVICE—412-361-5291 (1) Status of order or back order (2) If any merchandise purchased within 60 days from S.D. of A. is defective, please call for a return authorization number. Defective merchandise will be replaced with the same merchandise only. Other returns subject to a 15% restocking charge. After 60 days please refer to the manufacturers warranty included with the merchandise & return directly to the manufacturer. Customer service will not accept collect calls or calls on S.D. of A.'s 800+ order lines! Have you seen our on line catalog of 1000 software titles for Commodore, Atari, Apple, IBM and Amiga! It's on Compuserve's Electronic Mall—just type GO SDA and shopping for software will never be the same again! HOURS: Mon.-Fri. 9AM-5:30 PM, Sat. 10AM-4PM Eastern Time. Because this ad had to be written 2-3 mos. before it was published, prices & availability are subject to change! New titles are arriving daily! Please call for more information!

\$5.95 All this software without typing—yours for only \$5.95. Your double-sided Antic Monthly Disk has every type-in program from this issue, plus this month's Super Disk Bonus and other extras. Shipment within 24 hours is guaranteed when you phone your MasterCard or Visa order to the Disk Desk: (415) 957-0886.

TYPING SPECIAL ATARI CHARACTERS	64
HOW TO USE TYPO II	65

DISK SUBSCRIBERS: Programs for 8-bit Atari computers can be used immediately. Just follow instructions in the accompanying magazine articles. ST Owners: See monthly disk's ST Help File for instructions on how to transfer programs to 3-1/2 inch disk.

DOS COMPATIBILITY: All 8-bit programs published by Antic are tested to work with Atari Disk Operating System (DOS) 2.0S and 2.5—not with the incompatible DOS 3.0. DOS 2.0S is available on each Antic Monthly Disk. Copy the DOS.SYS and DUP.SYS files.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise, without the prior written permission of the publisher.

TYPING SPECIAL ATARI CHARACTERS

Antic printed program listings leave a small space between each Atari Special Character for easier reading. Immediately below you will see the way Antic prints all the standard Atari letters and numbers, in upper and lower case, in normal and inverse video.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9

The Atari Special Characters and the keys you must type in order to get them are shown in the two boxes below.

NORMAL VIDEO			
FOR THIS	TYPE THIS	FOR THIS	TYPE THIS
CTRL ,		CTRL S	
CTRL A		CTRL T	
CTRL B		CTRL U	
CTRL C		CTRL V	
CTRL D		CTRL W	
CTRL E		CTRL X	
CTRL F		CTRL Y	
CTRL G		CTRL Z	
CTRL H		ESC ESC	
CTRL I		ESC CTRL -	
CTRL J		ESC CTRL =	
CTRL K		ESC CTRL +	
CTRL L		ESC CTRL *	
CTRL M		CTRL .	
CTRL N		CTRL ;	
CTRL O		SHIFT =	
CTRL P		ESC SHIFT	
CTRL Q		CLEAR	
CTRL R		ESC DELETE	
		ESC TAB	

INVERSE VIDEO			
FOR THIS	TYPE THIS	FOR THIS	TYPE THIS
CTRL ,		CTRL X	
CTRL A		CTRL Y	
CTRL B		CTRL Z	
CTRL C		ESC	
CTRL D		SHIFT	
CTRL E		DELETE	
CTRL F		ESC	
CTRL G		SHIFT	
CTRL H		INSERT	
CTRL I		ESC	
CTRL J		CTRL	
CTRL K		TAB	
CTRL L		ESC	
CTRL M		SHIFT	
CTRL N		TAB	
CTRL O		CTRL .	
CTRL P		CTRL ;	
CTRL Q		SHIFT =	
CTRL R		ESC CTRL 2	
CTRL S		ESC	
CTRL T		CTRL	
CTRL U		DELETE	
CTRL V		ESC	
CTRL W		CTRL	
		INSERT	

Whenever the CONTROL key (CTRL on the 400/800) or SHIFT key is used, *bold it down* while you press the next key. Whenever the ESC key is pressed, *release* it before you type the next key.

Turn on inverse video by pressing the Reverse Video Mode Key . Turn it off by pressing it a second time. (On the 400/800, use the Atari Logo Key instead.)

Among the most common program typing mistakes are switching certain capital letters with their lower-case counterparts—you need to look especially carefully at P, X, O and 0 (zero).

Some of Atari Special Characters are not easy to tell apart from standard alpha-numeric characters. Usually the Special Characters will be boxed. Compare the two sets of characters below:

SPECIAL		STANDARD	
	CTRL F		
	CTRL G		SHIFT +
	CTRL N		SHIFT -
	CTRL R		
	CTRL S		

HOW TO USE TYPO II (8-BIT)

TYPO II automatically proofreads Antic's type-in BASIC listings for 8-bit Atari computers. It finds the exact line where you made a program typing mistake.

Type in TYPO II and SAVE a copy to disk or cassette. Now type GOTO 32000. When you see the instruction on the screen, type in a single program line **without the two-letter TYPO II code** at the left of the line number. Press the [RETURN] key.

Your line will reappear at the bottom of the screen with a two-letter TYPO II code on the left. If this code is not exactly the same as the line code printed in the magazine, you mistyped something in that line.

To call back any line previously typed, type an asterisk [*] followed (without in-between spaces) by the line number, then press [RETURN]. When the complete line appears at the top of the screen, press [RETURN] again. This is also the way you use TYPO II to proofread itself.

To LIST your program, press [BREAK] and type LIST. To return to TYPO II, type GOTO 32000.

To remove TYPO II from your program, type LIST "D:FILENAME",0,31999 [RETURN] (Cassette owners LIST "C:"). Type NEW, then ENTER "D:FILENAME"[RETURN](Cassette—ENTER "C:"). Your program is now in memory without TYPO II and you can SAVE or LIST it to disk or cassette.

Don't type the
TYPO II Codes!

LOTTERY PLAYERS

**Why guess at those lotto numbers!
 Your computer can give you a real edge in those big state lottos!**

"The Lotto Program" will quickly tell you which numbers you should be playing! No random numbers, this program actually analyzes the past winners so you can project which numbers will likely come up in the next few drawings. You simply add the latest winners each week and the program does the rest. It's fun and easy to use and could be worth millions of dollars! APPLE, C/64, IBM and ATARI 800/130 versions are ONLY \$21.95. The Super Macintosh version is only \$29.95. Visa, MC or checks welcome. Please add \$1.50 for shipping. We give good fast service!

LOOP TOGGLE

This routine from Ken Cox of Fayetteville, Arkansas lets you toggle a programming loop with the [SPACEBAR] key:

```
10 FOR DELAY=1 TO 200:NEXT DELAY
100 REM START ROUTINE
110 IF PEEK(764)=33 THEN POKE 764,255:
CLOSE #2:OPEN #2,4,0,"K:":GET #2,KEY:
CLOSE #2
120 REM END ROUTINE
130 PRINT "WHAT A TIP!"
140 GOTO 10
```

SINGLE KEY INPUT ROUTINE

Carl Evans says he uses this neat little routine in just about every BASIC program he writes. You will find that it provides quite a programming convenience when you want to use a single key to answer a prompt or a question displayed on the screen. Subroutine KEY.LST simply tells the computer to wait for the operator to press a key on the keyboard. Upon RETURN from the subroutine, you will have the ATASCII value of the character, corresponding to the key that was pressed, stored in KEY. Here's the subroutine:

```
20440 REM KEY.LST
20441 OPEN #6,4,0,"K:":
20442 GET #6,KEY
20443 REM PUT SPECIAL EXIT #1 HERE
20444 REM PUT SPECIAL EXIT #2 HERE
20445 CLOSE #6:RETURN
```

Essentially, this routine OPENS the keyboard as a "device," just as if it was a printer or disk drive. In this particular routine the device number is 6. If the program you want to put this routine into is already using this device number for something else, you can change it to 4, 5, or some other legal number. Avoid using device 0 or 7, because the operating system uses them and results could be unpredictable. The screen editor uses device 0, and 7 is used by LIST, LOAD, PRINT and RUN. Caution: always CLOSE a device when you are through with it.

When this routine is called, the ATASCII code for the key you hit is stored in the variable KEY. Any special exit conditions must test KEY against the proper ATASCII codes.

AUTOBOOT SANS BASIC

This self-booting routine disables XL/XE internal BASIC and frees 8K of RAM. It does *not* disable external cartridges, disturb Atari 400s or 800s or require re-execution when you press [RESET], nor will it execute if BASIC is already disabled. This tip comes from Chris Richardson of Warren, Indiana. When RUN, this file creates BASDIS.EXE, which you can rename to AUTORUN.SYS.

```
10 OPEN #1,8,0,"D:BASDIS.EXE"
20 FOR Z=1 TO 90:READ D:PUT #1,D:CK=CK+D:NEXT Z
30 IF CK<>8790 THEN ?:"CHECK TYPING OF DATA STATEMENTS"
40 CLOSE#1:END
1000 DATA 255,255,0,6,77,6,173,31,208,41,4,240,68,173,19,208,208,63,173,248
,3,208,58
1001 DATA 173,1,211,9,2,141,1,211,169,192,133,106
1002 DATA 141,248,3,169,12,141,66,3,162,0,32,86
1003 DATA 228,169,3,141,66,3,169,12,141,74,3,169,6,141,69,3,169,76,141,68,3
1004 DATA 169,2,141,72,3,162,0,142,73,3,32,86,228,96,69,58,226,2,227,2,0,6
```

FUNCTION KEY VALUE CHART

You can use this handy chart by Carl Evans to help your program keep track of which console key is being pressed.

Keys Pressed	PEEK(53279)	Binary Code
None	7	00000111
START	6	00000110
SELECT	5	00000101
START and SELECT	4	00000100
OPTION	3	00000011
START and OPTION	2	00000010
SELECT and OPTION	1	00000001
All Three	0	00000000

If you have a Tech Tip that you would like to share with other readers, send it along to Antic Tech Tips, 544 Second Street, San Francisco, CA 94107. You might get your name in print. We always welcome very short programs that demonstrate the Atari's powers, simple hardware modifications, or useful macros for popular software. ■

INSTANT SCREEN FILL

Instantly filling your screen with a character is an old programming trick. Here's how Carl Evans, author of *Atari BASIC, Faster and Better*, does it on the 8-bit Atari.

The DATA statements in lines 110-150 contain the decimal number "translation" of a 34-byte USR routine. Lines 170-180 put the values into the first 34 bytes of Page Six—a 256-byte block of memory starting at location 1536 (\$0600) which BASIC and DOS leave free for your use. The screen fill routine is relocatable, so you can replace the addresses in line 160. Just make sure that the location is safe and the value of MLEND is 33 more than MLSTART.

```
100 REM SFILL.DEM—SCREEN FILL FROM BASIC
110 DATA 104,201,1,208,254,104,104,170
120 DATA 165,88,133,204,165,89,133,205
130 DATA 138,160,0,145,204,230,204,208
140 DATA 250,230,205,166,205,224,160,208
150 DATA 242,96
160 MLSTART=1536:MLEND=1569
170 FOR X=MLSTART TO MLEND
180 READ Y:POKE X,Y:NEXT X
200 PRINT CHR$(125):PRINT
210 PRINT "SFILL.DEM—SCREEN FILL
FROM BASIC"
220 PRINT:PRINT:PRINT
"ENTER CHARACTER: ";
230 OPEN #2,4,0,"K:":TRAP 230
240 GET #2,KEY:CLOSE #2
250 X=USR(1536,KEY-32)
260 GOTO 260
```

Want to be rich and famous?

Can you draw a song?

**Like to modemcast a concert using your computer
as the music maker?**

Okay hot shot. Boot up or shut up.

You haven't been challenged in years. You're bored cracking code, bragging you're top gun. Can you really create with the best? Prove it to us and we'll prove it to the world. Forget breaking some other guy's patterns and paths. What do you do when you have to input your own imagination and create from scratch? We're launching the next generation entertainment system: multiplayer musical telegames, and multimedia musical shows. We're looking for a few great talents to meet the challenge. Here's your chance to boot up or shut up.

First step: turn on our operating system. It changes your Atari 800XL and 130XE or your Commodore 64 and 128 from an 8-bit, 4-cylinder wheezer into a mach 2 turbo machine that can take on any work station. It's VIRTUOSO® Software, the first Music Graphics Animator. It's Patent Pending, and the 16-bit version is on the way; MIDI, too.

VIRTUOSO is the master program powerful enough to handle your deepest creativity—the first music animation and modemcasting studio on a disk.

Compose music instantly without reading notes. Animate music with graphics controlled by music, or music controlled by graphics. Compose and edit, draw and maneuver multiple graphic objects—in real time. Add scrolling lyrics or text; treat words like graphics. Sync them all together. Modem them around the world.

Here's your challenge. Using VIRTUOSO Software, design a prototype musical telegame or show. Send us your best ideas in VIRTUOSO storyboard format. We will publish what we judge to be the best programs. Virtusonics Corporation will enter into a licensing agreement, helping you turn your prototype into a commercial program. Show makers win big cash prizes, too.

And you, hot shot, will get full author's credit and royalties. Plus the chance to give your own modemcast concert.

Yes, the company that produced VIRTUOSO Software, Virtusonics Corporation, also recognizes VIRTUOSO innovators and publishes their work.

For \$49.95 you get everything you need—the VIRTUOSO Software disk, complete contest information, and the starter kit from CompuServe—their INTRO-PAK™ that gives you instant access to CompuServe plus \$15 towards your first tab.

VIRTUOSO Software should be available where you buy software. You can also shop the CompuServe Electronic Mall™. Or order from us directly with your check or credit card. (\$3.00 extra for shipping.)

We're here to help you get off the ground and program like a virtuoso. Our service hot line is open weekdays, 10AM to 5PM Eastern time. It's your move.

From the world of sound!

ST-Replay

ST-Replay is an exciting new program that allows you to digitize and replay various sounds, including musical instruments, television programs, even your own voice.

ST-Replay comes with a cartridge that connects directly to the cartridge port of the Atari ST, and is capable of sampling sound from any source similar to a cassette player,

HI-FI, or compact disc player. *ST-Replay* also accepts amplified sources, so the cleaner the sound the better the sample.

All of this only begins to describe the incredible power of this utility. You can save samples to disk, load from a disk, change the speed of a sample, cut and paste areas of a sample, and much, much more!

Color or Monochrome...\$159.95

DIGI-DRUM

Turn your Atari ST into a sizzling digitized drum machine with Digi-Drum. From the cool syncopated beat of a jazz improv-

isation to the martial flare of a staccato snare, you can experience it all, digitally, with this amazing program. Also Digi-Drum is compatible with the sound digitizer *ST-Replay* (see above).

Color or Monochrome...\$39.95

Arcade fun!

Airball

Now you're really in trouble said the Evil Wizard, "I'm turning you into a ball and sending you into a mansion with over 250 rooms!!

If that sounds easy I'm telling you it's not. Your ball has got a slow leak and you'll need to jump on a pump to pump yourself up, but the pumps are hidden in only a few rooms. Also don't pump yourself up to much or you'll explode.

In the rooms you'll have to pick up objects that have been left behind, such as crosses, tins of beans, a Buddha, and a dragon statue. At the end of the maze is a spell book that will turn you back into a human again. "Sounds easy" you say to the wizard as he laughs and says, "there is much more in store for you!"

Color only...\$39.95

Gold Runner

The earth is dying. Mass migration to a new planet is our only hope. To reach this new world, travelers must pass through a hostile section of the universe known as the Ring Worlds of Triton. Only One can lead humanity into the golden age and be worthy of the title: GOLD RUNNER. Only One shall survive the final debacle, amid the meteor storms of Triton...let it be you.

Color only...\$39.95
